AIS-BPV

AIS By-Pass Valve

AIS-CC

AIS Computer Controlled

AIS-CKV

AIS Check Valve

AIS-CSV

AIS Control Solenoid Valve

AIS-CV

AIS Combination Valve

AIS-DV

AIS Diverter Valve

AIS-IMCV

AIS Intake Manifold Change-Over Valve

AIS-MCV

AIS Manifold Change-Over Valve

AIS-PAF

AIS Pulse Air Feeder

AIS-PM

AIS Pump Motor

AIS-PV

AIS Pneumatic Valve

AIS-RV

AIS Relief Valve

AIS-SAV

AIS Secondary Air Valve

AIS-SOL

AIS Solenoid

AIS-SV

AIS Solenoid Valve

AIS-VCV

AIS Vacuum Control Valve

AIS-VSV

AIS Vacuum Switching Valve

AIS-VT

AIS Vacuum Tank

AIS-VCV

AIS Vacuum Control Valve

AIS-VSV

AIS Vacuum Switching Valve

AIV

Air Injection Valve

AIV-SOL

Air Injection Valve Solenoid

ALVW

Adjusted Loaded Vehicle Weight

AMV

Air Management Valve

AP

Air Pump Injection System

AP-ACV

AP Air Control Valve

AP-AMV

AP Air Management Valve

AP-ASRV

AP Air Switching Relief Valve

AP-ASS

AP Air Switching Solenoid

AP-ASV

AP Air Switching Valve

AP-BPV

AP By-Pass Valve

AP-CKV

AP Check Valve

AP-CS

AP Control Solenoid

AP-DCTO

AP Dual Coolant Temperature Override

AP-DLY

AP Delay Valve

AP-DV

AP Diverter Valve

AP-EADV

AP Electric Air Control Diverter Valve

AP-EAMR

AP Electric Air Management Relay

AP-EAMS

AP Electric Air Management Solenoid

AP-EAP

AP Electric Air Pump

AP-EC

AP Electromagnetic Clutch

AP-ERLY

AP Electric Air Pump Relay

AP-RDV

AP Reed Valve

AP-RV

AP Relief Valve

AP-SOL

AP Solenoid

AP-SOV

AP Shut-Off Valve

AP-SV

AP Solenoid Valve

AP-SWV

AP Switchover Valve

AP-TV

AP Transmitting Valve

AP-VCS

AP Vacuum Control Solenoid

AP-VCSV

AP Vacuum Controlled Air Shut-Off Valve

AP-VCV

AP Vacuum Control Valve

AP-VSV

AP Vacuum Switching Valve

A/T

Automatic Transmission

ATCV

Air Temperature Control Valve

"B"**BP/EGR**

Backpressure EGR System

BP/EGR-BPS

BP/EGR Backpressure Sensor

BP/EGR-BPT

BP/EGR Backpressure Transducer

"C"

C-4

Computer Controlled Catalytic Converter

CAC

Charge Air Cooler

CAS

Clean Air System

CB

Crankcase Breather

CB-VC

Crankcase Breather-Vapor Canister

CBPS

Coasting By-Pass System

CBVC

Crankcase Breather Vapor Canister

CCIEV

Coolant Controlled Idle Enrichment Valve

CCS

Controlled Combustion System

CCV

Closed Crankcase Ventilation

CD-REGVLV

Crankcase Depression Regulator Valve

CDRV

Crankcase Depression Relief Valve

CEAB

Cold Engine Air Bleed

CEAB-TVS

CEAB Thermal Vacuum Switch

CEAB-TVV

CEAB Thermal Vacuum Valve

CEC

Computerized Engine Controls

CESS

Cold Engine Sensor Switch

CETS

Cold Engine Temperature Switch

CFI

Continuous Fuel Injection

CMH

Cold Mixture Heater

CNG

Compressed Natural Gas

CO

Carbon Monoxide

CO₂

Carbon Dioxide

CPI

Central Port Injection

CRV

Coasting Richer Valve

CSI

Central Sequential Injection

CTAVS

Cold Temperature Activated Vacuum System

CTOX

Continuous Trap Oxidizer

"D"**DCLV**

Deceleration Valve

DCS

Deceleration Control System

DDI

Direct Diesel Injection

DFI

Direct Diesel Injection

DI

Direct Injection

DKV

Deceleration Kick Valve

DMCV

Deceleration Mixture Control Valve

DMS

Dual Manifold System

DOC

Diesel Oxidation Catalyst

DOHC

Dual Overhead Cam

DPF

Diesel Particulate Filter

DPFE

Differential Pressure Feedback EGR Valve

DPFEGR

Differential Pressure Feedback EGR Valve

DTM

Deceleration Throttle Modulator

"E"

ACCESSORIES & EQUIPMENT

Air/Wind Noise - Spark

DIAGNOSTIC INFORMATION AND PROCEDURES

AIR/WIND NOISE

Special Tools

- **CH-39570** Chassis Ear
- **GE-41416** Ultrasonic Leak Detector

WARNING: Refer to Assistant Driving Warning .

To analyze a reported windnoise condition, test drive the vehicle to determine the origin of the noise.

Choose a regular route with smooth and straight streets that run in all 4 directions: North, South, East, and West. The area should have little traffic or little noise in order to eliminate interference with the test.

NOTE: Often there is one primary leak source and one or more secondary leaks that contribute to the noise condition. Repairing only one of the contributing leak sources may not completely repair the total condition but only reduce the condition.

Drive the vehicle at the speed in which the noise was noticed, or until the noise is heard. Maintain safe and legal speeds.

Many of the waterleak diagnosis tests are also used for the windnoise diagnosis.

Most windnoise is caused either by leaking seals or by misaligned body surfaces. You can diagnose the following types of windnoise with the aid of **CH-39570** chassis ear or **GE-41416** leak detector.

- Wind whistle
- Wind roar
- Wind rush

When moving at highway speeds, air pressure inside the vehicle becomes greater than the air pressure outside. When a leak occurs, the escaping air causes a hiss or a whistle.

Wind roar occurs when air passes over or through an opening between the 2 body surfaces. To correct the condition, adjust the alignment to the body surfaces.

Wind rush occurs when air presses over the vehicles body and is related to the aerodynamics of the vehicle.

Wind whistle and wind roar are repairable. Rule out wind whistle and wind roar before concluding that the wind noise is due to wind rush.

Use the following inspections in order to aid in diagnosing wind whistle or wind roar:

1. Note the details for wind noise:
 - The perceived location
 - The location where the noise is loudest
 - When the noise occurs
 - The vehicle speed
 - The interior fan speed
 - The position of the windows
 - What the noise sounds like
2. Inspect the vehicle for the possible cause of the windnoise.
3. Test drive the vehicle and determine if the windnoise is external or internal.
4. Perform a visual inspection of the following components:
 - Loose fasteners
 - Torn weatherstrips
 - Broken weld joints
 - Sealer and/or adhesive skips

TRACING POWDER OR CHALK TEST

Clean the weatherstrips and the contact surfaces with cleaning solvent.

1. Apply powder or chalk in an unbroken line to the contact surface of the weatherstrip surrounding the perimeter of the suspected areas.
2. Close the panel completely without slamming the panel. Closing the panel completely presses the weatherstrip firmly against the mating surface.
3. Inspect the applied line on the weatherstrip. The applied line is marred where contact is good. A corresponding imprint is on the mating surfaces.
4. Gaps or irregularities in the powder or the chalk line on the mating surfaces indicate the areas with a poor seal.

AIR PRESSURE TEST

1. Mask off both the pressure relief valves.
2. Close all the windows.
3. Turn the vehicles ventilation fan to the on position, with the selector on high speed and in the defrost mode.
4. Unlock and close the doors.
5. Listen for escaping air along the door and the window seals with a stethoscope or a length of heater hose.

SOAP SUDS OR BUBBLE TEST

1. Mask off the pressure relief valves.
2. Close all the windows and the doors.
3. Turn the vehicles ventilation fan to the on position, with the selector on high speed and in the defrost mode.
4. Unlock and close the doors.
5. Apply the soap solution to the potential leak areas.
6. Look for bubbles revealing escaping air.

REPAIR INSTRUCTIONS

EXTERIOR WINDNOISE

WARNING: Refer to Assistant Driving Warning .

Exterior windnoise is louder when the vehicle is driven with one or more windows down. Exterior windnoise occurs when air passes over the body panels, the seams, or the openings. Use the following items during the test drive in order to aid in the detection of leaks:

- Mechanic's stethoscope or heater hose
 - Masking tape-51 mm (2 in) width
 - Strip caulk
 - A water soluble marking pencil
1. While driving, determine the location of the exterior windnoise by lowering one window at a time. If the location corresponds with the condition in step 2, pull over and make a temporary repair with 51 mm (2 in) wide masking tape.
 2. Tape over the gaps and the moldings one at a time. Test between each taping. Taping over the gaps and moldings will correct the condition.
 3. Temporarily repair the condition with masking tape. Adjust the tape when needed.
 4. Continue testing in order to determine if the noise has been eliminated or other leak areas exist.
 5. When all the reported leak conditions are located, make permanent repairs using the proper alignment techniques and the sealing materials.

INTERIOR WINDNOISE

WARNING: Refer to Assistant Driving Warning .

Interior windnoise is not heard when the window is lowered. Interior windnoise is caused by the air leaving the inside of the vehicle through a seal or a seam.

1. Tape over the relief valves to cause added air pressure within the vehicle.
2. Test drive the vehicle and listen for windnoise or a whistle.
3. Pull the vehicle over and make the temporary repairs using masking tape. If you cannot determine the source of the windnoise, perform one or more of the following diagnostic tests:
 - Air Pressure Test
 - Soap Suds or Bubble Test
 - Tracing Powder or Chalk Test

DTC B2745: TRACTION CONTROL SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B2745 02

Traction Control Switch Circuit Short to Ground

DTC B2745 71

Traction Control Switch Circuit Invalid Data

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B2745 02, B2745 71	1	1	B2745 71

Ground	-	1	-	-
1. Traction control switch inoperative				

Circuit/System Description

The Body Control Module monitors the Vehicle Stability Control Switch. When the Traction Control Switch is pressed once, the Body Control Module will request the Electronic Brake Control Module via serial data to disable the traction control. The Electronic Brake Control Module will request the Instrument Cluster via serial data to turn the Traction Control Off Indicator ON to notify the driver of the deactivation.

When the Traction Control Switch is pressed and held for five seconds, the Body Control Module will request the Electronic Brake Control Module to disable the traction control and the electronic stability control. The Electronic Brake Control Module will request the Instrument Cluster via serial data to turn the Traction Control Off and the Stability Control Off Indicator ON to notify the driver of the deactivation.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

B2745 02

The Body Control Module detects a short to ground on the signal circuit.

B2745 71

The Body Control Module detects an erratic signal or invalid serial data from the Traction Control Switch.

Action Taken When the DTC Sets

- The Body Control Module ignores the Traction Control Switch signal input.
- The Electronic Brake Control Module disables the vehicle stability enhancement system for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A DTC will not clear the current status until the next ignition cycle.
- A history DTC will clear once 40 malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Ignition ON
2. Verify the Instrument Cluster Traction Control indicator turns ON and OFF when commanding the Instrument Cluster All Indicators ON and OFF with a scan tool.
 - **If the indicator does not turn ON and OFF**

Replace the P16 Instrument Cluster.
 - **If the indicator turns ON and OFF**
3. Verify the scan tool Traction Control Switch parameter changes between Active and Inactive while pressing and releasing the S75 Traction Control Switch.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
4. All OK.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, and all vehicle systems OFF, disconnect the harness connector at the S75 Traction Control Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 4 and ground.

- **If 10 ohms or greater**
 1. Ignition OFF
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
- 3. Ignition ON.
- 4. Verify the scan tool Body Control Module Traction Control Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 18 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 4
- 6. Verify the scan tool Traction Control Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
- 7. Test or replace the S75 Traction Control Switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S75 Traction Control Switch.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 4 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S75 Traction Control Switch.
 - **If infinite resistance**
3. Test for less than 2 ohms between the signal terminal 2 and the ground terminal 4 with the switch in the closed position.
 - **If 2 ohms or greater**

Replace the S75 Traction Control Switch.

- If less than 2 ohms

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Heater and Air Conditioning Control Replacement (Left Hand Drive)** , **Heater and Air Conditioning Control Replacement (Right Hand Drive)** for Traction Control Switch replacement.
- Refer to **Control Module References** for Body Control Module, Electronic Brake Control Module or Instrument Cluster replacement, programming and setup

DTC C0035, C0040, C0045, OR C0050: WHEEL SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Component	Condition	DTC Symptom Bytes
Wheel Speed Sensor	- Physical damage - Debris on the wheel speed sensor or the encoder ring - Loose or worn wheel bearing - Loose or improperly mounted sensor - Air gap between the wheel speed sensor and the encoder ring too large - Water intrusion in the wiring harness	0F, 18, or 5A

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder ring consists of permanent magnets. Each wheel speed sensor receives ignition voltage from the electronic brake control module and provides an alternating current square wave signal to the electronic brake control module. As the wheel spins, the electronic brake control module uses the frequency of the square wave signal to calculate the wheel speed.

Conditions for Running the DTC

C0035 06, C0040 06, C0045 06, or C0050 06

- Ignition ON.
- Ignition voltage is greater than 8 V.

C0035 0F, C0040 0F, C0045 0F, or C0050 0F

- Ignition ON.
- Ignition voltage is greater than 8 V.
- Vehicle speed is greater than 20 km/h (12 MPH).

C0035 18, C0040 18, C0045 18, or C0050 18

- Ignition ON.
- Ignition voltage is greater than 8 V.
- No other wheel speed circuit DTCs are set.
- At least two other wheel speed circuits are not 0 km/h (0 MPH).

C0035 5A, C0040 5A, C0045 5A, or C0050 5A

- Ignition ON.
- Ignition voltage is greater than 8 V.
- The vehicle speed is greater than 20 km/h (12 MPH).

Conditions for Setting the DTC

C0035 06, C0040 06, C0045 06, or C0050 06

- A short to voltage is detected on a wheel speed signal.
- A short to ground or an open/high resistance is detected on a wheel speed signal.
- A short to ground or an open/high resistance is detected on a wheel speed ignition circuit.

C0035 18, C0040 18, C0045 18, or C0050 18

- One wheel speed is less than 2 km/h (1.2 MPH).
- The remaining wheel speeds are greater than 10 km/h (6.2 MPH) for 0.154 seconds.
- The difference between the remaining wheel speeds are less than 4 km/h (2.5 MPH) from each other for more than 2 minutes.

C0035 0F, C0040 0F, C0045 0F, or C0050 0F

The electronic brake control module detected a rapid variation in the wheel speed. The wheel speed changes 20 km/h (12 MPH) or more in 0.7 seconds. The change must occur 56 times with no more than 0.7 seconds between occurrences.

C0035 5A, C0040 5A, C0045 5A, or C0050 5A

The difference between fastest and slowest wheel speed is greater than 60% for more than 2 minutes.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON, if equipped with electronic stability control.
- The electronic brake distribution does not function optimally with multiple wheel speed sensor DTCs set.
- The electronic brake control module disables the ABS, the traction control and the stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

- Do not use a magnet to clean the encoder ring.
- Inspect the wheel hub bearing encoder ring for rust or corrosion.
- Inspect the wheel speed sensor for contamination, physical damage, and correct installation.
- If two or more wheel speed sensors are inoperative, diagnose each wheel speed sensor individually.
- If any of the symptom codes 0F, 18 or 5A are set, refer to the Diagnostic Fault Information table for possible mechanical faults or conditions.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Circuit/System Verification

1. Test drive the vehicle in a straight line at a speed greater than 40 km/h (25 MPH).
2. Verify all scan tool Wheel Speed Sensor parameters are within 4 km/h (2.5 MPH) of each other.
 - **If any parameter is not within 4 km/h (2.5 MPH) of each other**

Refer to Circuit/System Testing.

- **If each parameter is within 4 km/h (2.5 MPH) of each other**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate B5 Wheel Speed Sensor and the harness connector at the K17 Electronic Brake Control Module, ignition ON.
2. Test for less than 1 V between the appropriate K17 Electronic Brake Control Module harness connector terminals listed below and ground:
 - B5LF Wheel Speed Sensor - Left Front - terminal 34 and terminal 21
 - B5LR Wheel Speed Sensor - Left Rear - terminal 33 and terminal 20
 - B5RF Wheel Speed Sensor - Right Front - terminal 18 and terminal 31
 - B5RR Wheel Speed Sensor - Right Rear - terminal 19 and terminal 32
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**
3. Ignition OFF.
 4. Test for infinite resistance between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
 - B5LF Wheel Speed Sensor - Left Front - terminal 34 and terminal 21
 - B5LR Wheel Speed Sensor - Left Rear - terminal 33 and terminal 20
 - B5RF Wheel Speed Sensor - Right Front - terminal 18 and terminal 31
 - B5RR Wheel Speed Sensor - Right Rear - terminal 19 and terminal 32
 - **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**
5. Test for less than 2 ohms between the B5 Wheel Speed Sensor harness connector terminal 1 and the K17 Electronic Brake Control Module harness connector terminal listed below:
 - B5LF Wheel Speed Sensor - Left Front - terminal 34

- B5LR Wheel Speed Sensor - Left Rear - terminal 33
- B5RF Wheel Speed Sensor - Right Front - terminal 18
- B5RR Wheel Speed Sensor - Right Rear - terminal 19
- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

6. Test for less than 2 ohms between the B5 Wheel Speed Sensor harness connector terminal 2 and the K17 Electronic Brake Control Module harness connector terminal listed below:

- B5LF Wheel Speed Sensor - Left Front - terminal 21
- B5LR Wheel Speed Sensor - Left Rear - terminal 20
- B5RF Wheel Speed Sensor - Right Front - terminal 31
- B5RR Wheel Speed Sensor - Right Rear - terminal 32
- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

7. Replace the B5 Wheel Speed Sensor.

8. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.

- **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Component	Condition	DTCs
Pump Motor	• Wear • Damage • Lock	C0110 61

Circuit/System Description

The pump motor is an integral part of the brake pressure modulator, while the pump motor relay is integral to the electronic brake control module. The pump motor relay is not engaged during normal system operation. When ABS operation is required the electronic brake control module activates the pump motor relay and battery voltage is provided to the pump motor.

Conditions for Running the DTC

C0110 04 or C0110 06

Ignition ON.

C0110 61

- The vehicle speed is greater than 20 km/h (13 MPH), and brake is not applied.
- The test is initiated once per ignition cycle, when the vehicle speed is greater than 15 km/h (9 MPH), and a fault was set on the last ignition cycle.

Conditions for Setting the DTC

C0110 04 or C0110 06

- The ground circuit is open, and the feedback voltage is greater than 5 V for 0.5 seconds, the pump is not activated.
- The electronic brake control module detects a low voltage in the pump motor supply circuit when the feedback voltage is less than 5 V for greater than 500 ms, and the pump motor is not activated.

C0110 61

The pump motor continues to rotate briefly after deactivation creating a feedback voltage. The electronic brake control module sets the DTC if the measured feedback voltage indicates a binding or stalled pump motor.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON, if equipped with electronic stability control.
- The electronic brake control module disables the ABS, the traction control and the electronic stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Verification

1. Ignition ON
2. Verify the ABS pump motor turns ON and OFF when commanding the ABS Pump Motor ON and OFF with a scan tool.
 - **If the pump motor does not turn ON and OFF**
 - Refer to Circuit/System Testing.
 - **If the pump motor turns ON and OFF**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminals listed below and ground:
 - Terminal 13
 - Terminal 38
 - **If 10 ohms or greater**
 1. Ignition OFF
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the Q5 Brake Pressure Modulator.

- **If the test lamp illuminates**

5. Replace the Q5 Brake Pressure Modulator.
6. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
 - **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

7. All OK.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0131 00

Traction Control System Pressure Circuit Malfunction

DTC C0131 5A

Traction Control System Pressure Circuit Not Plausible

Circuit/System Description

The electronic brake control module monitors the brake pressure sensor which is integral to the brake pressure modulator. The body control module monitors the brake pedal position sensor signal when the brake pedal is

applied and sends a serial data message to the electronic brake control module indicating the brake pedal position. The electronic brake control module compares the brake pressure to the brake pedal position and uses this information for vehicle stability control.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

C0131 00

The electronic brake control module detects the brake pressure is out of specified range.

C0131 5A

The electronic brake control module does not detect that the master cylinder pressure changed after driving the vehicle at a speed greater than 40 km/h (25 MPH) and performing three brake stops.

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- The electronic brake control module disables the traction/stability or the duration of the ignition cycle, and the ABS remains functional.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

Diagnose all other stop lamp DTCs or Symptoms prior to performing this diagnostic procedure.

DTC Descriptors

DTC C0161 5A

Antilock Brake System Brake Switch Not Plausible

DTC C0161 71

Antilock Brake System Brake Switch Invalid Data

Circuit/System Description

When the brake pedal is applied, the body control module sends a serial data message to the electronic brake control module in reference to the brake pedal positions. The electronic brake control module compares the correlation between the brake pedal position and the amount of brake pressure it senses from the brake pressure sensor, which is internal to the brake pressure modulator. It uses this information to control the vehicle during an stability control event.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

- The electronic brake control module detects the brake pedal is not applied when the brake pressure is greater 15 bar (218 PSI) for 3 seconds.
- The electronic brake control module does not detect that the stop lamp switch signal changed after driving the vehicle at a speed greater than 40 km/h (25 MPH) and performing three brake stops.

Action Taken When the DTC Sets

- The traction/stability control indicator off turns ON, if equipped with electronic stability control.

- The electronic brake control module disables the traction/stability for the duration of the ignition cycle, and the ABS remains functional.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

- DTC C0161 may set if the brake pedal is applied while accelerating.
- Diagnose all other stop lamp DTCs or Symptoms prior to performing this diagnostic procedure.

DTC C0186, C0187, C0196, OR C0287: LATERAL ACCELERATION SENSOR/MULTI-AXIS ACCELERATION SENSOR/YAW RATE SIGNAL/LONGITUDINAL ACCELERATION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0186

Lateral Acceleration Sensor Signal (Inflatable Restraint Sensing and Diagnostic Module)

DTC C0187

Multi-Axis Acceleration Sensor Circuit (Electronic Brake Control Module)

DTC C0196

Yaw Rate Signal (Inflatable Restraint Sensing and Diagnostic Module and/or Electronic Brake Control Module)

DTC C0287

Longitudinal Acceleration Sensor Signal (Inflatable Restraint Sensing and Diagnostic Module and/or Electronic Brake Control Module)

For symptom byte information refer to **Symptom Byte List** .

Circuit/System Description

The yaw rate, lateral acceleration and longitudinal acceleration sensors are combined into one multi-axis acceleration sensor, internal to the inflatable restraint sensing and diagnostic module. The multi-axis acceleration sensor communicates with the electronic brake control module via serial data. The electronic brake control module activates the stability control function depending on the multi-axis acceleration sensor input. The inflatable restraint sensing and diagnostic module uses the multi-axis acceleration sensor to determine if the vehicle is in a roll over or near collision incident.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

C0186 00 or C0187 5A

- The lateral acceleration signal offset is out of the specified range.
- An internal fault in multi-axis acceleration sensor will set this DTC.
- Improperly mounted or loose inflatable restraint sensing and diagnostic module may set this DTC.
- The lateral acceleration signal is not plausible with the yaw rate, the steering wheel angle signal and the vehicle speed.

C0196 5A

- The yaw rate signal is out of the specified range.
- An internal fault in multi-axis acceleration sensor may set DTC C0196 5A.
- Improperly mounted or loose inflatable restraint sensing and diagnostic module may set this DTC.
- The yaw rate signal is not plausible with the lateral acceleration signal, the steering wheel angle sensor signal and the vehicle speed.

C0196 00

The yaw rate signal is out of the specified range.

C0287 00

The longitudinal acceleration signal is out of the specified range.

C0287 5A

- An Internal fault in multi-axis acceleration sensor will set this DTC.
- The longitudinal acceleration signal is not plausible with the vehicle acceleration.

Action Taken When the DTC Sets

- The Air Bag Indicator turns ON.
- The traction/stability control indicator turns ON.

- The electric brake control module disables the stability control and the Hill Start Assist for the duration of the ignition cycle.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

DTC C0201: ANTILOCK BRAKING SYSTEM ENABLE RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0201 00

Antilock Braking System Enable Relay Primary Circuit

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+ Terminal 1	C0201 00	C0201 00	-	-
Ground Terminal 13	-	C0110 04, C0110 06	-	-
Ground Terminal 38	-	U0121	-	-

Circuit/System Description

Battery positive voltage is supplied to the electronic brake control module at all times through a 40 A fuse located in the underhood fuse block. The electronic brake control module uses this voltage to power the pump motor. The pump motor is an integral part of the brake pressure modulator, while the pump motor relay is integral to the electronic brake control module. The pump motor relay is not engaged during normal system operation. When the ABS, traction/stability operation is required the electronic brake control module activates the pump motor relay and turns the pump motor ON.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

The pump motor supply voltage is less than 4 V.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON, if equipped with electronic stability control.
- The electronic brake control module disables the ABS, the traction control and the stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between each ground circuit terminal listed below and ground:
 - Terminal 13
 - Terminal 38
 - **If 10 ohms or greater**
 1. Ignition OFF
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the Q5 Brake Pressure Modulator.
 - **If the test lamp illuminates**
5. Replace the Q5 Brake Pressure Modulator.
6. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
 - **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

 - **If the DTC does not set**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC C0242 OR P0856: POWERTRAIN CONTROL MODULE INDICATED TRACTION CONTROL/TRACTION CONTROL TORQUE REQUEST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0242 00

Powertrain Control Module Indicated Traction Control

DTC P0856

Traction Control Torque Request Circuit

Circuit/System Description

When traction control is active, the Electronic Brake Control Module sends a serial data message to the Engine Control Module requesting torque reduction. When certain Engine Control Module DTCs are set, the Engine Control Module will not be able to perform the torque reduction for traction control. A serial data message is sent to the Electronic Brake Control Module indicating that traction control is not allowed.

Conditions for Running the DTC

Engine running.

Conditions for Setting the DTC

The Engine Control Module detects a fault that prevents it from performing a traction control function and sends a serial data message to the Electronic Brake Control Module indicating that torque reduction is not allowed.

Action Taken When the DTC Sets

- The Traction/stability Control Indicator Off turns ON, if equipped with electronic stability control.
- The Electronic Brake Control Module disables the Traction/stability Control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

DTC C0277: BRAKE PEDAL POSITION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0277 4B

Brake Pedal Position Sensor Circuit Calibration Not Learned

Circuit/System Description

When the brake pedal is applied, the body control module sends a serial data message to the electronic brake control module in reference to the brake pedal positions. The electronic brake control module compares the correlation between the brake pedal position and the amount of brake pressure it senses from the brake pressure sensor, which is internal to the brake pressure modulator. It uses this information to control the vehicle during an stability control event.

Conditions for Running the DTC

- Brakes Applied.
- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

- The body control module sends invalid brake pedal position data to the electronic brake control module.
- The DTC may set in the body control module and/or electronic brake control module, when the brake pedal position sensor home position is not learned.

Actions Taken When the DTC Sets

- The ABS indicator is commanded ON.
- The red brake indicator is commanded ON.
- The stop lamps may not activate at the expected brake pedal positions.
- The traction/stability control indicator turns ON, if equipped with electronic stability control.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A DTC will not clear the current status until the next ignition cycle.
- A successful brake pedal position sensor calibration has been performed.
- A history DTC will clear once 40 malfunction-free ignition cycles have occurred.

DTC C027C: FRONT BRAKE DISCS HIGH TEMPERATURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C027C

Front Brake Discs High Temperature

For symptom byte information refer to **Symptom Byte List** .

Circuit/System Description

The electronic brake control module monitors how often the traction control or the stability control system activates in order to calculate an estimate of the front brake discs temperature. In most cases the high temperatures are caused by extended traction control activation. If the electronic brake control module calculates that the front brake components temperatures are too high, the electronic brake control module will temporarily suspend the traction control system function until the front brake discs cool down.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The electronic brake control module detects the calculated temperature of the brake components is higher than 500°C (932°F).

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- The electronic brake control module disables the traction control and stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

DTC C027C does not indicate a malfunction has occurred. This DTC indicates there was excessive traction control or stability control activation that caused the high temperatures.

Circuit/System Verification

NOTE: Since most occurrences of this DTC are caused by excessive brake usage, review with the customer the conditions under which the DTC set.

1. Allow the brakes to cool down before performing test.
2. Verify that no other DTCs are set.
 - **If any other DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no other DTCs are set**
- 3. Verify DTC C027C does not set while driving the vehicle under normal braking conditions. Refer to **Brake System Vehicle Road Test** .
 - **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**
4. All OK.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0292 1A

Multi-Axis Acceleration Sensor Module Circuit Performance - Bias Level Out of Range

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
12 V Reference	U0125, C0292 1A	U0125	-	-

Ground	-	U0125	-	-
--------	---	-------	---	---

Circuit/System Description

The Lateral Accelerometer and the Yaw Rate Sensors are combined into one sensor called the Multi-axis Acceleration Sensor. The Electronic Brake Control Module supplies a 12 V reference to the Multi-axis Acceleration Sensor. The Multi-axis Acceleration Sensor communicates with the Electronic Brake Control Module via serial data. The module activates the stability control function depending on Multi-axis Acceleration Sensor input.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

The Electronic Brake Control Module detects that the sensor supply voltage feedback indicates that the voltage level is less or greater than 1 V for more than 100 milliseconds.

Action Taken When the DTC Sets

- The Electronic Brake Control Module shuts down the 12 V reference to the multi-axis acceleration sensor.
- The Electronic Brake Control Module disables the vehicle stability enhancement system for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

1. Verify the B119 Multi-axis Acceleration Sensor is installed correctly.
 - **If loose or incorrect installation**

Correct the installation of the component.
 - **If installed correctly**
2. Ignition OFF, scan tool disconnected, and all vehicle systems OFF, disconnect the harness connector at the B119 Multi-axis Acceleration Sensor. It may take up to 2 minutes for all vehicle systems to power down.
3. Test for less than 5 ohms between the ground circuit terminal 6 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
4. Ignition ON.
5. Verify that a test lamp illuminates between the 12 V reference circuit terminal 5 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
 2. Test for infinite resistance between the 12 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 12 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If the test lamp illuminates**
6. Replace the B119 Multi-axis Acceleration Sensor.
7. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.

- **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

8. All OK.

System Disabled Information Stored Acceleration Pedal Position Out of Range

DTC C0561 79

System Disabled Information Stored Transmission Gear Invalid Data

Circuit/System Description

The electronic brake control module disables the traction and the stability control when other electronic control modules set DTCs for components that effect the operation of the brake system.

Conditions for Running the DTC

- Engine Running.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

The electronic brake control module receives an invalid serial data message from another module more than ten times.

Action Taken When the DTC Sets

- The ABS system remains functional.
- The electronic brake control module disables the stability control for the entire ignition cycle.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

This DTC indicates there are no problems in the brake system. The body control module, engine control module, and transmission control module should be checked for a possible fault first.

Circuit/System Verification

C0561 77 or C0561 78

1. Ignition ON.
2. Verify there are no other DTCs set.
 - **If any other DTCs are set**

Refer to the **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no other DTCs are set**
3. Replace the K20 Engine Control Module.
 4. Verify the DTC does not set while operating the vehicle within the conditions for Running the DTC.
 - **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**
5. All OK.

C0561 79

1. Ignition ON.
2. Verify there are no other DTCs set.
 - **If any other DTCs are set**

Refer to the **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no other DTCs are set**
3. Replace the K71 Transmission Control Module.
 4. Verify the DTC does not set while operating the vehicle within the conditions for Running the DTC.
 - **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Electronic Brake Control Module, Engine Control Module, or Transmission Control Module replacement, programming and setup

DTC C056D: ELECTRONIC CONTROL UNIT HARDWARE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C056D 00

Electronic Control Unit Hardware Malfunction

Circuit/System Description

The Electronic Brake Control Module detects an internal malfunction.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

The Electronic Brake Control Module detects an internal malfunction.

Action Taken When the DTC Sets

- The ABS Indicator turns ON.
- The red Brake Warning Indicator turns ON.
- The Traction/stability Control Indicator turns ON, if equipped with electronic stability control.
- The Electronic Brake Control Module disables the ABS, and the Traction/stability for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

DTC Descriptors

DTC C056E 42

Electronic Control Unit Software Calibration Not Programmed

DTC C056E 47

Electronic Control Unit Software VIN Not Programmed

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

A new service replacement Electronic Brake Control Module contains a unique manufacturing calibration. This DTC will be current whenever a new Electronic Brake Control Module is installed on a vehicle prior to the Service Programming System (SPS) event. The DTC will remain current until the Electronic Brake Control Module has undergone a successful program. Once the program event is completed, the DTC goes into history and can be cleared. After the DTC is cleared it can not return.

Action Taken When the DTC Sets

- The ABS Indicator turns ON.
- The red Brake Warning Indicator turns ON.
- The Traction/stability Control Indicator turns ON, if equipped with electronic stability control.
- The Electronic Brake Control Module disables the ABS, and the Traction/stability for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

DTC C0710: STEERING WHEEL ANGLE SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0710

Steering Wheel Angle Signal

For symptom byte information refer to **Symptom Byte List** .

Circuit/System Description

The steering wheel angle sensor is integrated in the steering column assembly. The steering wheel angle sensor identifies the position and direction of the steering wheel rotation.

The electronic brake control module receives high speed serial data inputs from the steering angle sensor identifying the position and direction of the steering wheel rotation. The electronic brake control module utilizes this signal to calculate the driver intended driving direction.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

C0710 4B

The steering angle sensor is not calibrated.

C0710 5A

- The steering angle signal is out of the specified range.
- The steering angle signal offset is out of the specified range.

C0710 71

The steering angle signal is not plausible with the multi-axis acceleration signal.

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- The electronic brake control module disables the traction control and the electronic stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

- Check and adjust all tires to the stated cold air pressure as identified on the tire placard.
- The car should not pull in either direction causing the steering wheel to be off center while driving in a straight line on a level surface.
- Confirm that all tires are of the proper size and matching brands. If a mis-sized or non-matching brand tire is present, inform the customer that in order for the vehicle stability enhanced system to function normally, tires need to be a uniform size and rolling diameter.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Steering Wheel Angle parameter value constantly changes from +550 to -550° as the steering wheel is turned through its entire range from left to right.
 - **If the parameter does not change**

Calibrate the K43 Power Steering Control Module.
 - **If the parameter changes**
3. Verify that DTC C0710 4B is not set.
 - **If DTC C0710 4B is set**

Perform the **Steering Angle Sensor Centering**.
 - **If DTC C0710 4B is not set**
4. Verify that DTC C0460 is not set.
 - **If DTC C0460 is set**

Refer to **DTC C0460** .
 - **If DTC C0460 is not set**

5. Replace the steering column assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Steering Column Replacement (Electric Power Steering)**
- **Control Module References** for power steering control module replacement, programming and setup.

SYMPTOMS - ANTILOCK BRAKE SYSTEM

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to **ABS Description and Operation (With FX3)**, **ABS Description and Operation (Without FX3)**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the ABS. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **ABS Indicator Malfunction**
- **Brake Warning Indicator Malfunction**
- **Traction Control/Stability Control Indicator Malfunction**

ABS INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The Instrument Cluster turns the ABS indicator ON for five seconds after the ignition is turned ON, or when the Electronic Brake Control Module detects a fault and sends a serial data message to the Instrument Cluster commanding the indicator ON.

Control Module References for scan tool information.

Circuit/System Verification

1. Ignition ON.
2. Verify that no DTCs are set.
 - **If any DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are set**
3. Verify the Instrument Cluster ABS indicator turns ON and OFF when commanding the All Indicators ON

and OFF with a scan tool.

- **If the ABS indicator does not turn ON and OFF**

Replace the P16 Instrument Cluster.

- **If the ABS indicator turns ON and OFF**

4. Verify the ABS indicator turns off five seconds after the ignition is turned ON.

- **If the ABS indicator does not turn OFF**

Replace the K17 Electronic Brake Control Module.

- **If the ABS indicator turns OFF**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Electronic Brake Control Module or Instrument Cluster replacement, programming and setup

TRACTION CONTROL/STABILITY CONTROL INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B2745 02, B2745 71	1	1	B2745 71
Ground	-	1	-	-
1. Traction control malfunction				

Circuit/System Description

The Instrument Cluster illuminates the Traction/stability Control Indicator, Traction Control Off Indicator and Stability Control Off Indicator for five seconds after the ignition is turned ON. When the Electronic Brake Control Module detects a fault it sends a serial data message to the Instrument Cluster commanding the Traction/stability Control indicator ON.

The Body Control Module monitors the signal circuit from the Traction Control Switch. When the Traction Control Switch is pressed once, the Body Control Module sends a serial data message to the Electronic Brake Control Module to disable the traction control system. When the Traction Control Switch is pressed and held for five seconds, the Body Control Module will request the Electronic Brake Control Module to disable the electronic stability control. The Electronic Brake Control Module will request the Instrument Cluster to turn the Traction Control Off and Stability Control Off Indicator ON to notify the driver of the deactivation.

Description and Operation

ABS Description and Operation (With FX3), ABS Description and Operation (Without FX3)

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Ignition ON
2. Verify the Instrument Cluster indicators listed below turn ON and OFF when commanding the All Indicators ON and OFF with a scan tool.
 - Traction Control Off indicator
 - Stability Control Off indicator
 - Traction/stability Control indicator
 - **If the indicator does not turn ON and OFF**

Replace the P16 Instrument Cluster.

- **If the indicator turns ON and OFF**

3. Verify the scan tool Electronic Brake Control Module Traction Control Switch parameter changes between Active and Inactive while pressing and releasing the S75 Traction Control Switch.

- **If the parameter does not change**

Refer to Circuit/System Testing.

- **If the parameter changes**

4. All OK.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, and all vehicle systems OFF, disconnect the harness connector at the S75 Traction Control Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 4 and ground.

- **If 5 ohms or greater**

1. Ignition OFF
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 5 ohms**

3. Ignition ON.
4. Verify the scan tool Traction Control Switch parameter is Inactive.

- **If not Inactive**

1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the signal circuit terminal 18 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 4.
6. Verify the scan tool Traction Control Switch parameter is Active.

- **If not Active**

1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If Active**

7. Test or replace the S75 Traction Control Switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S75 Traction Control Switch.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 4 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S75 Traction Control Switch.
 - **If infinite resistance**
3. Test for less than 2 ohms between the signal circuit terminal 2 and the ground terminal 4 with the switch in the closed position.
 - **If 2 ohms or greater**

Replace the S75 Traction Control Switch.
 - **If less than 2 ohms**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Heater and Air Conditioning Control Replacement (Left Hand Drive)** , **Heater and Air Conditioning Control Replacement (Right Hand Drive)** for Traction Control Switch replacement.
- Refer to **Control Module References** for Body Control Module, Electronic Brake Control Module or Instrument Cluster replacement, programming and setup

REPAIR INSTRUCTIONS

ANTILOCK BRAKE SYSTEM AUTOMATED BLEED

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

NOTE: Before performing the Antilock Brake System (ABS) Automated Bleed Procedure, first perform a pressure bleed of the base brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** , **Hydraulic Brake System Bleeding (Pressure)** . The automated bleed procedure is recommended when one of the following conditions exists:

- **Base brake system bleeding does not achieve the desired pedal height or feel.**
- **Extreme loss of brake fluid has occurred.**
- **Air ingestion is suspected in the secondary circuits of the hydraulic brake modulator assembly.**

The ABS Automated Bleed Procedure uses a scan tool to cycle the system solenoid valves and run the pump in order to purge any air from the secondary circuits. These circuits are normally closed off and are only opened during system initialization at vehicle start up and during ABS operation. The automated bleed procedure opens these secondary circuits and allows any air trapped in these circuits to flow out toward the brake calipers.

CAUTION: The Auto Bleed Procedure may be terminated at any time during the process by pressing the EXIT button. No further Scan Tool prompts pertaining to the Auto Bleed procedure will be given. After exiting the bleed procedure, relieve bleed pressure and disconnect bleed equipment per manufacturers instructions. Failure to properly relieve pressure may result in spilled brake fluid causing damage to components and painted surfaces.

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove all four tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
3. Inspect the brake system for leaks and visual damage. Refer to **Symptoms - Hydraulic Brakes** , repair or replace components as needed.
4. Lower the vehicle.
5. Inspect the battery state of charge. Refer to **Battery Inspection/Test** .
6. Install a scan tool.
7. Turn the ignition ON, with the engine OFF.
8. With the scan tool, establish communications with the ABS system. Select Control Functions. Select Automated Bleed from the Control Functions menu.
9. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
10. Following the directions given on the scan tool, pressure bleed the base brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** , **Hydraulic Brake System Bleeding (Pressure)** .
11. Follow the scan tool directions until the desired brake pedal height is achieved.
12. If the bleed procedure is aborted, a malfunction exists. Perform the following steps before resuming the bleed procedure:
 - If a DTC is detected, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** , and diagnose the appropriate DTC.
 - If the brake pedal feels spongy, perform the conventional brake bleed procedure again. Refer to **Hydraulic Brake System Bleeding (Manual)** , **Hydraulic Brake System Bleeding (Pressure)** .
13. When the desired pedal height is achieved, press the brake pedal to inspect for firmness.
14. Lower the vehicle.
15. Remove the scan tool.

16. Install the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
17. Inspect the brake fluid level. Refer to **Master Cylinder Reservoir Filling** .
18. Road test the vehicle while inspecting that the pedal remains high and firm.

STEERING ANGLE SENSOR CENTERING

The steering angle sensor does not require centering often. Centering of the steering angle sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Wheel alignment
- Steering gear replacement
- Steering column replacement
- Collision or other physical damage
- Power steering control module replacement
- Electronic brake control module replacement

The steering angle sensor centering procedure can be completed with a scan tool using the following steps:

1. Using the steering wheel, align and center the front wheels forward.
2. Apply the parking brake, or set the transmission in Park.
3. Install the scan tool to the data link connector.
4. Turn the ignition ON, and the engine OFF.
5. With the scan tool select the Power Steering Control Module.
6. Select the Steering Wheel Angle Sensor Centering in the Steering Wheel Angle Sensor Centering Configuration/Reset Functions list.
7. Follow the scan tool directions to complete the learn procedure.
8. Clear any DTCs that may be set.
9. Turn OFF the ignition.

ELECTRONIC BRAKE CONTROL MODULE REPLACEMENT

Fig. 4: Electronic Brake Control Module
 Courtesy of GENERAL MOTORS COMPANY

Electronic Brake Control Module Replacement

Callout	Component Name
WARNING: Refer to <u>Brake Fluid Irritant Warning</u> .	
CAUTION: Always connect or disconnect the wiring harness connector from the EBCM/EBTCM with the ignition switch in the OFF position. Failure to observe this precaution could result in damage to the EBCM/EBTCM.	
Preliminary Procedure Remove the EBCM/BPMV assembly from the vehicle. Refer to <u>Brake Pressure Modulator Valve Replacement</u> .	
1	Electronic Brake Control Module Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.8 N.m (25 lb in)
2	Brake Pressure Modulator Valve

Electronic Brake Control Module

Procedure

3

1. Separate the EBCM from the BPMV by carefully pulling apart. DO NOT pry the components apart.
2. If a new EBCM is being installed, program the EBCM. Refer to **Control Module References**

BRAKE PRESSURE MODULATOR VALVE REPLACEMENT

Removal Procedure

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Always connect or disconnect the wiring harness connector from the EBCM/EBTCM with the ignition switch in the OFF position. Failure to observe this precaution could result in damage to the EBCM/EBTCM.

1. Turn the ignition switch to the OFF position.

NOTE: The area around the EBCM/BPMV assembly must be free from loose dirt to prevent contamination of disassembled ABS components.

2. Clean the electronic brake control module (EBCM) to the brake pressure modulator valve (BPMV) area of any accumulated dirt and foreign material.

Fig. 5: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the electrical connector (1) from the EBCM.

Fig. 6: RF Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the RF brake pipe fitting (1) from the BPMV.

Cap the brake pipe fitting and plug the BPMV outlet port to prevent brake fluid loss and contamination.

5. Disconnect the LR brake pipe fitting (2) from the BPMV.

Cap the brake pipe fitting and plug the BPMV outlet port to prevent brake fluid loss and contamination.

6. Disconnect the RR brake pipe fitting (3) from the BPMV.

Cap the brake pipe fitting and plug the BPMV outlet port to prevent brake fluid loss and contamination.

7. Disconnect the LF brake pipe fitting (4) from the BPMV.

Cap the brake pipe fitting and plug the BPMV outlet port to prevent brake fluid loss and contamination.

Fig. 7: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the master cylinder primary brake pipe fitting (1) from the BPMV.
Cap the brake pipe fitting and plug the BPMV inlet port to prevent brake fluid loss and contamination.
9. Disconnect the master cylinder secondary brake pipe fitting (2) from the BPMV.
Cap the brake pipe fitting and plug the BPMV inlet port to prevent brake fluid loss and contamination.

Fig. 8: EBCM/BPMV Bracket Bolt/Nut
Courtesy of GENERAL MOTORS COMPANY

10. Remove the EBCM/BPMV bracket bolt/nut (1).
11. Remove the EBCM/BPMV bracket assembly (2) from the vehicle.

Fig. 9: EBCM/BPMV Assembly And Bracket
Courtesy of GENERAL MOTORS COMPANY

12. Remove the EBCM/BPMV assembly to the EBCM/BPMV assembly bracket retaining bolts (1).
13. Remove the EBCM/BPMV assembly (2) from the bracket (3).
14. If installing a new BPMV, remove the EBCM. Refer to **Electronic Brake Control Module Replacement**.

Installation Procedure

1. If installing a new BPMV, install the EBCM. Refer to **Electronic Brake Control Module Replacement**.

Fig. 10: EBCM/BPMV Assembly And Bracket
Courtesy of GENERAL MOTORS COMPANY

2. Install the EBCM/BPMV assembly (2) to the EBCM/BPMV assembly bracket (3).

CAUTION: Refer to Fastener Caution .

3. Install the EBCM/BPMV assembly to EBCM/BPMV assembly bracket retaining bolts (1) and tighten to 11 N.m (97 lb in).

Fig. 11: EBCM/BPMV Bracket Bolt/Nut
Courtesy of GENERAL MOTORS COMPANY

4. Install the EBCM/BPMV bracket assembly (2) to the vehicle.
5. Install the EBCM/BPMV bracket bolt/nut (1) and tighten to 22 N.m (16 lb ft).

Fig. 12: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

6. Connect the master cylinder primary brake pipe fitting (1) to the BPMV.

Tighten

- For only ABS, tighten the fitting to 18 N.m (13 lb ft).
- For ESC, tighten the fitting to 25 N.m (18 lb ft).

7. Connect the master cylinder secondary brake pipe fitting (2) to the BPMV.

Tighten

- For only ABS, tighten the fitting to 18 N.m (13 lb ft).
- For ESC, tighten the fitting to 25 N.m (18 lb ft).

Fig. 13: RF Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

8. Connect the LF brake pipe fitting (4) to the BPMV and tighten to 18 N.m (13 lb ft).
9. Connect the RR brake pipe fitting (3) to the BPMV and tighten to 18 N.m (13 lb ft).
10. Connect the LR brake pipe fitting (2) to the BPMV and tighten to 18 N.m (13 lb ft).
11. Connect the RF brake pipe fitting (1) to the BPMV and tighten to 18 N.m (13 lb ft).

Fig. 14: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

12. Connect the EBCM electrical connector to the EBCM.
13. Bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding (Manual) , Hydraulic Brake System Bleeding (Pressure) .
14. Perform the Diagnostic System Check - Vehicle. Refer to Diagnostic System Check - Vehicle .
15. Observe the brake pedal feel after performing the diagnostic system check. If the pedal now feels spongy, air may have been in the secondary hydraulic circuit of the brake modulator which may have been introduced into the primary circuit. If the pedal feels spongy, perform the Antilock Brake System Automated Bleed Procedure. Refer to Antilock Brake System Automated Bleed.

BRAKE PRESSURE MODULATOR VALVE BRACKET REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Always connect or disconnect the wiring harness connector from the EBCM/EBTCM with the ignition switch in the OFF position. Failure to

observe this precaution could result in damage to the EBCM/EBTCM.

1. Turn the ignition switch to the OFF position.

NOTE: **The area around the EBCM/BPMV assembly must be free from loose dirt to prevent contamination of disassembled ABS components.**

2. Clean the electronic brake control module (EBCM) to the brake pressure modulator valve (BPMV) area of any accumulated dirt and foreign material.

Fig. 15: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the electrical connector (1) from the EBCM.

Fig. 16: RF Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the RF brake pipe fitting (1) from the BPMV.

Cap the brake pipe fitting and plug the BPMV outlet port to prevent brake fluid loss and contamination.

5. Disconnect the LR brake pipe fitting (2) from the BPMV.

Cap the brake pipe fitting and plug the BPMV outlet port to prevent brake fluid loss and contamination.

6. Disconnect the RR brake pipe fitting (3) from the BPMV.

Cap the brake pipe fitting and plug the BPMV outlet port to prevent brake fluid loss and contamination.

7. Disconnect the LF brake pipe fitting (4) from the BPMV.

Cap the brake pipe fitting and plug the BPMV outlet port to prevent brake fluid loss and contamination.

Fig. 17: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the master cylinder primary brake pipe fitting (1) from the BPMV.
Cap the brake pipe fitting and plug the BPMV inlet port to prevent brake fluid loss and contamination.
9. Disconnect the master cylinder secondary brake pipe fitting (2) from the BPMV.
Cap the brake pipe fitting and plug the BPMV inlet port to prevent brake fluid loss and contamination.

Fig. 18: EBCM/BPMV Bracket Bolt/Nut
Courtesy of GENERAL MOTORS COMPANY

10. Remove the EBCM/BPMV bracket bolt/nut (1).
11. Remove the EBCM/BPMV bracket assembly (2) from the vehicle.

Fig. 19: EBCM/BPMV Assembly And Bracket
Courtesy of GENERAL MOTORS COMPANY

12. Remove the EBCM/BPMV assembly to the EBCM/BPMV assembly bracket retaining bolts (1).
13. Remove the EBCM/BPMV assembly bracket (3) from the EBCM/BPMV assembly (2).

Installation Procedure

Fig. 20: EBCM/BPMV Assembly And Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Install the EBCM/BPMV assembly bracket (3) to the EBCM/BPMV (2) assembly.

CAUTION: Refer to Fastener Caution .

2. Install the EBCM/BPMV assembly to EBCM/BPMV assembly bracket retaining bolts (1) and tighten to 11 N.m (97 lb in).

Fig. 21: EBCM/BPMV Bracket Bolt/Nut
Courtesy of GENERAL MOTORS COMPANY

3. Install the EBCM/BPMV bracket assembly (2) to the vehicle.
4. Install the EBCM/BPMV bracket bolt/nut (1) and tighten to 22 N.m (16 lb ft).

Fig. 22: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

5. Connect the master cylinder primary brake pipe fitting (1) to the BPMV.

Tighten

- For only ABS, tighten the fitting to 18 N.m (13 lb ft).
- For ESC, tighten the fitting to 25 N.m (18 lb ft).

6. Connect the master cylinder secondary brake pipe fitting (2) to the BPMV.

Tighten

- For only ABS, tighten the fitting to 18 N.m (13 lb ft).
- For ESC, tighten the fitting to 25 N.m (18 lb ft).

Fig. 23: RF Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

7. Connect the LF brake pipe fitting (4) to the BPMV and tighten to 18 N.m (13 lb ft).
8. Connect the RR brake pipe fitting (3) to the BPMV and tighten to 18 N.m (13 lb ft).
9. Connect the LR brake pipe fitting (2) to the BPMV and tighten to 18 N.m (13 lb ft).
10. Connect the RF brake pipe fitting (1) to the BPMV and tighten to 18 N.m (13 lb ft).

Fig. 24: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

11. Connect the EBCM electrical connector (1) to the EBCM.
12. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** , **Hydraulic Brake System Bleeding (Pressure)** .
13. Perform the Diagnostic System Check - Vehicle. Refer to **Diagnostic System Check - Vehicle** .
14. Observe the brake pedal feel after performing the diagnostic system check. If the pedal now feels spongy, air may have been in the secondary hydraulic circuit of the brake modulator which may have been introduced into the primary circuit. If the pedal feels spongy, perform the Antilock Brake System Automated Bleed Procedure. Refer to **Antilock Brake System Automated Bleed**.

FRONT WHEEL SPEED SENSOR REPLACEMENT (RIGHT SIDE)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

Fig. 25: Radiator Surge Tank Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the radiator surge tank mounting bolts (1), and detach the radiator surge tank without disconnecting the coolant hose, and position it aside to get a hand access. Refer to **Radiator Surge Tank Replacement (LL0)** , **Radiator Surge Tank Replacement (LFM)** .

Fig. 26: Wheel Speed Sensor Electrical Connector

5. Attach the wheel speed sensor harness to from the body frame mounted bracket (2).
6. Connect the wheel speed sensor electrical connector (1).
7. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.

VEHICLE YAW SENSOR LEARN

The yaw sensor does not require calibration often. Calibration of the yaw rate sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Electronic brake control module (EBCM) replacement
- Multi-axis acceleration sensor replacement

The yaw rate sensor calibration procedure can be completed with a scan tool using the following steps:

1. Place vehicle on a level surface.
2. Apply the parking brake, or set the transmission in the park (P) position.
3. Install the scan tool to the data link connector.

4. Turn the ignition ON, and the engine OFF.
5. Select Yaw Rate Sensor Reset in the Multi-axis Acceleration Sensor Module Control Functions list.
6. Follow the scan tool directions to complete the calibration procedure.
7. Select Yaw Rate Sensor Learn in the Multi-axis Acceleration Sensor Module Control Functions list.
8. Follow the scan tool directions to complete the calibration procedure.
9. Clear any DTCs that may be set.

VEHICLE YAW SENSOR LEARN

Vehicle Yaw Sensor Replacement

Callout	Component Name
Preliminary Procedure Remove the front floor console. Refer to Front Floor Console Replacement .	
1	Vehicle Yaw Sensor Nut (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)
2	Vehicle Yaw Sensor Procedure 1. Disconnect the electrical connector 2. After the installation is complete, reset the yaw rate sensor. using the following procedure: • Install a scan tool. • Using the scan tool, calibrate the yaw rate sensor.

DESCRIPTION AND OPERATION

ABS DESCRIPTION AND OPERATION (WITH FX3)

This vehicle is equipped with the MGH 60 Mando electronic stability control antilock brake system. The electronic brake control module and the brake pressure modulator are serviced separately. The brake pressure modulator uses a four circuit configuration to control hydraulic pressure to each wheel independently.

The following vehicle performance enhancement systems are provided.

- ABS
- Electronic brake distribution
- Hill Start Hold
- Traction Control System
- Vehicle Stability Enhancement System

The following components are involved in the operation of the above systems.

- Electronic Brake Control Module-The electronic brake control module controls the system functions and detects failures.
- Brake pressure modulator-The brake pressure modulator contains the hydraulic valves and pump motor that are controlled electrically by the electronic brake control module. The brake pressure modulator uses a four circuit configuration with a diagonal split. The brake pressure modulator directs fluid from the reservoir of the master cylinder to the left front and right rear wheels and fluid from the other reservoir to the right front and left rear wheels. The diagonal circuits are hydraulically isolated so that a leak or malfunction in one circuit will allow continued braking ability on the other.

The brake pressure modulator contains the following components:

- Pump motor
- Inlet valves (one per wheel)
- Outlet valves (one per wheel)
- Two traction control/stability control supply valves
- Two traction control/stability control isolation valves
- Brake pressure sensor
- Wheel speed sensors - The wheel speed sensors are Active sensors that receive a 12-volt power supply voltage from the electronic brake control module and provides an output signal to the module. As the wheel spins, the wheel speed sensor sends the electronic brake control module a DC square wave signal. The electronic brake control module uses the frequency of the square wave signal to calculate the wheel speed.
- Traction Control Switch - The vehicle stability enhancement system and the engine torque reduction function of the traction control system are manually disabled or enabled by pressing the traction control switch.
- Steering Wheel Angle Sensor - The electronic brake control module receives serial data message inputs

from the steering wheel angle sensor. The steering wheel angle signal is used to calculate the driver intended driving direction.

- **Multi-axis Acceleration Sensor** - The yaw rate and lateral acceleration sensors are combined into one multi-axis acceleration sensor, external to the electronic brake control module. The electronic brake control module receives serial data message inputs from the yaw rate and lateral acceleration sensor and activates stability control depending on multi-axis acceleration sensor input.

Initialization Sequence

The electronic brake control module performs one initialization test each ignition cycle. The initialization of the electronic brake control module occurs when both the following conditions occur:

- The vehicle speed is greater than 20 km/h (12 MPH).
- The stop lamp switch is not applied.

The initialization sequence cycles each solenoid valve and the pump motor, as well as the necessary relays, for approximately 1.5 seconds to check component operation. The electronic brake control module sets a DTC if any error is detected. The initialization sequence may be heard and felt while it is taking place, and is considered part of normal system operation.

The electronic brake control module defines a drive cycle as the completion of the initialization sequence.

Antilock Brake System

When wheel slip is detected during a brake application, the ABS enters antilock mode. During antilock braking, hydraulic pressure in the individual wheel circuits is controlled to prevent any wheel from slipping. A separate hydraulic line and specific solenoid valves are provided for each wheel. The ABS can decrease, hold, or increase hydraulic pressure to each wheel brake. The ABS cannot, however, increase hydraulic pressure above the amount which is transmitted by the master cylinder during braking.

During antilock braking, a series of rapid pulsations is felt in the brake pedal. These pulsations are caused by the rapid changes in position of the individual solenoid valves as the electronic brake control module responds to wheel speed sensor inputs and attempts to prevent wheel slip. These pedal pulsations are present only during antilock braking and stop when normal braking is resumed or when the vehicle comes to a stop. A ticking or popping noise may also be heard as the solenoid valves cycle rapidly. During antilock braking on dry pavement, intermittent chirping noises may be heard as the tires approach slipping. These noises and pedal pulsations are considered normal during antilock operation.

Vehicles equipped with ABS may be stopped by applying normal force to the brake pedal. Brake pedal operation during normal braking is no different than that of previous non-ABS systems. Maintaining a constant force on the brake pedal provides the shortest stopping distance while maintaining vehicle stability.

Pressure Hold

The electronic brake control module closes the inlet valve and keeps the outlet valve closed in order to isolate the system when wheel slip occurs. This holds the pressure steady on the brake so that the hydraulic pressure does not increase or decrease.

Pressure Decrease

The electronic brake control module decreases the pressure to individual wheels during a deceleration when wheel slip occurs. The inlet valve is closed and the outlet valve is opened. The excess fluid is stored in the accumulator until the return pump can return the fluid to the master cylinder.

Pressure Increase

The electronic brake control module increases the pressure to individual wheels during a deceleration in order to reduce the speed of the wheel. The inlet valve is opened and the outlet valve is closed. The increased pressure is delivered from the master cylinder.

Electronic Brake Distribution

The electronic brake distribution is a control system that replaces the hydraulic proportioning function of the mechanical proportioning valve in the base brake system. The electronic brake distribution control system is part of the operation software in the electronic brake control module. The electronic brake distribution uses active control with existing ABS in order to regulate the vehicle's rear brake pressure.

The red brake warning indicator is illuminated when the electronic brake distribution function is disabled.

Hill Start Hold

NOTE: The Hill Start Hold feature will not operate if the Stability control is disabled.

Some vehicles are equipped with the Hill Hold Start technology feature. When stopped on a hill, the Hill Start Hold feature prevents the vehicle from rolling before driving off, whether facing uphill or downhill by holding the brake pressure during the transition between when the driver releases the brake pedal and starts to accelerate. The Electronic Brake Control Module calculates the brake pressure, which is needed to hold the vehicle on an incline or grade greater than 5% and locks that pressure for up to two seconds by commanding the appropriate solenoid valves ON and OFF when the brake pedal is released. The stop lamps will stay illuminated during the Hill-Hold operation even though the brake pedal is released, this is considered normal operation.

The Hill Start Hold feature is determined by the electronic brake control module using the following inputs:

- Accelerator pedal position sensor
- Brake pedal position sensor
- Multi-axis acceleration sensor

Traction Control System

When drive wheel slip is noted while the brake is not applied, the electronic brake control module will enter traction control mode.

First, the electronic brake control module requests the engine control module to reduce the amount of torque to the drive wheels via the serial data. The engine control module reduces torque to the drive wheels by retarding spark timing and turning off fuel injectors. The engine control module reports the amount of torque delivered to

the drive wheels via the serial data circuit.

- Pressure hold
- Pressure increase
- Pressure decrease

Vehicle Stability Enhancement System

The vehicle stability enhancement system adds an additional level of vehicle control to the electronic brake control module.

Yaw rate is the rate of rotation about the vehicles vertical axis. The vehicle stability enhancement system is activated when the electronic brake control module determines that the desired yaw rate does not match the actual yaw rate as measured by the yaw rate sensor.

The desired yaw rate is calculated from the following parameters:

- The position of the steering wheel
- The speed of the vehicle
- The lateral acceleration of the vehicle

The difference between the desired yaw rate and the actual yaw rate is the yaw rate error, which is a measurement of over steer or under steer. If the yaw error becomes too large, the electronic brake control module attempts to correct the vehicles yaw rate motion by applying differential braking to the appropriate wheel. The amount of differential braking applied to the left or right front wheel is based on both the yaw rate error and side slip rate error.

The vehicle stability enhancement system activations generally occur during aggressive driving, in turns or on bumpy roads without much use of the accelerator pedal. When braking during vehicle stability enhancement system activation, the pedal pulsations feel different than the ABS pedal pulsations. The brake pedal pulsates at a higher frequency during vehicle stability enhancement system activation.

Driver Information Indicator

Brake Warning Indicator

The instrument cluster turns five brake warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The electronic brake control module detects some faults, such as more than two wheel speed sensors are defective or the failure relating to the basic brake system occurs and sends a serial data message to the instrument cluster requesting illumination.
- The park brake is engaged or the brake fluid level is low.

ABS Warning Indicator

The instrument cluster turns the ABS warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The electronic brake control module detects a malfunction which disables the ABS and sends a serial data message to the instrument cluster requesting illumination.

Traction Control System/Stability Control System Warning Indicator

The instrument cluster turns the traction control system/stability control system warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The electronic brake control module detects a malfunction which disables the traction control or stability control and sends a serial data message to the instrument cluster requesting illumination.

Traction Control System OFF Indicator

The instrument cluster turns the Traction Control Off indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The driver manually disables the traction control by pressing the traction control switch one time and releasing it. The body control module and electronic brake control module sends a serial data message to the instrument cluster requesting illumination.
- The electronic brake control module detects a malfunction which disables the traction control and sends a serial data message to the instrument cluster requesting illumination of the Traction Control Off indicator.

Stability Control System OFF Indicator

The instrument cluster turns the Stability Control Off indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The driver manually disables the stability control by pressing and holding the traction control switch down for five seconds. The electronic brake control module sends a serial data message to the instrument cluster requesting illumination.
- The electronic brake control module detects a malfunction which disables the stability control system it sends a serial data message to the instrument cluster requesting illumination of the Stability Control Off indicator.

ABS DESCRIPTION AND OPERATION (WITHOUT FX3)

This vehicle is equipped with the MGH 60 Mando antilock brake system. The electronic brake control module and the brake pressure modulator are serviced separately. The brake pressure modulator uses a 4 circuit configuration to control hydraulic pressure to each wheel independently.

The following vehicle performance enhancement systems are provided.

- Antilock brake system (ABS)
- Electronic brake distribution

The following components are involved in the operation of the above systems.

- Electronic brake control module -The electronic brake control module controls the system functions and detects failures.
- Brake pressure modulator -The brake pressure modulator contains the hydraulic valves and pump motor that are controlled electrically by the electronic brake control module. The brake pressure modulator uses a 4 circuit configuration with a diagonal split. The brake pressure modulator directs fluid from the reservoir of the master cylinder to the left front and right rear wheels and fluid from the other reservoir to the right front and left rear wheels. The diagonal circuits are hydraulically isolated so that a leak or malfunction in one circuit will allow continued braking ability on the other.

The brake pressure modulator contains the following components:

- Pump motor
 - Inlet valves (one per wheel)
 - Outlet valves (one per wheel)
- Wheel speed sensor - The wheel speed sensor receives a ignition voltage from the electronic brake control module and provides an output signal to the electronic brake control module. As the wheel spins, the wheel speed sensor sends the electronic brake control module a DC square wave signal. The electronic brake control module uses the frequency of the square wave signal to calculate the wheel speed.

Initialization Sequence

The electronic brake control module performs 1 initialization test each ignition cycle. The initialization of the electronic brake control module occurs when both the following conditions occur:

- The vehicle speed is greater than 20 km/h (12 mph).
- The stop lamp switch is not applied.

The initialization sequence cycles each solenoid valve and the pump motor, as well as the necessary relays, for approximately 1.5 seconds to check component operation. The electronic brake control module sets a DTC if any error is detected. The initialization sequence may be heard and felt while it is taking place, and is considered part of normal system operation.

The electronic brake control module defines a drive cycle as the completion of the initialization sequence.

Antilock Brake System

When wheel slip is detected during a brake application, the ABS enters antilock mode. During antilock braking, hydraulic pressure in the individual wheel circuits is controlled to prevent any wheel from slipping. A separate hydraulic line and specific solenoid valves are provided for each wheel. The ABS can decrease, hold, or increase hydraulic pressure to each wheel brake. The ABS cannot, however, increase hydraulic pressure above the amount which is transmitted by the master cylinder during braking.

During antilock braking, a series of rapid pulsations is felt in the brake pedal. These pulsations are caused by the rapid changes in position of the individual solenoid valves as the electronic brake control module responds to wheel speed sensor inputs and attempts to prevent wheel slip. These pedal pulsations are present only during antilock braking and stop when normal braking is resumed or when the vehicle comes to a stop. A ticking or popping noise may also be heard as the solenoid valves cycle rapidly. During antilock braking on dry pavement, intermittent chirping noises may be heard as the tires approach slipping. These noises and pedal pulsations are considered normal during antilock operation.

Vehicles equipped with ABS may be stopped by applying normal force to the brake pedal. Brake pedal operation during normal braking is no different than that of previous non-ABS systems. Maintaining a constant force on the brake pedal provides the shortest stopping distance while maintaining vehicle stability.

Pressure Hold

The electronic brake control module closes the inlet valve and keeps the outlet valve closed in order to isolate the system when wheel slip occurs. This holds the pressure steady on the brake so that the hydraulic pressure does not increase or decrease.

Pressure Decrease

The electronic brake control module decreases the pressure to individual wheels during a deceleration when wheel slip occurs. The inlet valve is closed and the outlet valve is opened. The excess fluid is stored in the accumulator until the return pump can return the fluid to the master cylinder.

Pressure Increase

The electronic brake control module increases the pressure to individual wheels during a deceleration in order to reduce the speed of the wheel. The inlet valve is opened and the outlet valve is closed. The increased pressure is delivered from the master cylinder.

Electronic Brake Distribution

The electronic brake distribution is a control system that replaces the hydraulic proportioning function of the mechanical proportioning valve in the base brake system. The electronic brake distribution control system is part of the operation software in the electronic brake control module. The electronic brake distribution uses active control with existing ABS in order to regulate the vehicle's rear brake pressure.

The red brake warning indicator is illuminated when the electronic brake distribution function is disabled.

Driver Information Indicator

Brake Warning Indicator

The instrument cluster turns the brake warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The park brake is engaged or the brake fluid level is low.
- The electronic brake control module detects some faults, such as more than two wheel speed sensors are

defective or the failure relating to the basic brake system occurs and sends a serial data message to the instrument cluster requesting illumination.

ABS Warning Indicator

The instrument cluster turns the ABS warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The electronic brake control module detects a malfunction which disables the ABS and sends a serial data message to the instrument cluster requesting illumination.

DIAGNOSTIC INFORMATION AND PROCEDURES

DIAGNOSTIC SYSTEM CHECK - AUTOMATIC TRANSMISSION

Circuit Description

The Diagnostic System Check - Automatic Transmission is an organized approach to identify a condition created by an automatic transmission. The Diagnostic System check is the diagnostic starting point for an automatic transmission concern. The Diagnostic System Check directs you to the next logical step for diagnosing a transmission concern. Perform this check only if there is a driveability concern or if you have been directed here from another service information section. Follow the table to help reduce diagnostic time and help prevent unnecessary replacement of good parts.

Diagnostic Aids

NOTE:

- Do not clear the DTC unless directed by a diagnostic procedure. Clearing the DTC will erase all Freeze Frame/Failure Records stored in engine control module (ECM) memory.
- Poor engine performance can sometimes be mis-diagnosed as a transmission concern. In order to avoid unnecessary transmission work, always perform the Diagnostic System Check - Vehicle .
- Use a scan tool that is known to function correctly. If necessary, test the scan tool on another vehicle.
- Ensure the scan tool contains the most current file available.
- The scan tool will display a loss of communication error message under the following conditions:
 - ECM power is interrupted.
 - The ignition switch is turned OFF.
 - The battery voltage level is very low.
 - A poor connection at the diagnostic link connector (DLC).

Test Description

The numbers below refer to the step numbers on the diagnostic table.

1

This step determines if the scan tool is receiving power through the DLC connector.

2

This step determines if the transmission control module (TCM) is transmitting serial data to the DLC and that the serial data circuit is not open or shorted.

3

This step determines if a TCM DTC is current or stored in history.

4

This step determines if the ECM is transmitting serial data to the DLC and that the serial data circuit is not open or shorted.

5

This step determines if an ECM DTC is current or stored in history.

Diagnostic System Check - Automatic Transmission

Step	Action	Yes	No
1	1. Install a scan tool. NOTE: Check for applicable service bulletins before proceeding with this test. Perform this test only if there is a driveability complaint or if you have been directed to this table from another section in the service information. Do not turn ignition OFF when performing this diagnostic procedure. Do not clear the DTCs unless instructed by this diagnostic procedure. 2. Turn ON the ignition, with the engine OFF. Does the scan tool power up?	Go to Step 2	Go to <u>Scan Tool Does Not Power Up</u>
2	Attempt to establish communication with the transmission control module (TCM). Does the scan tool communicate with the TCM?	Go to Step 3	Go to <u>Scan Tool Does Not Communicate with High Speed GMLAN Device</u>
3	Select the TCM DTCs function on the scan tool. Does the scan tool display any TCM DTCs?	Go to <u>Symptoms - Automatic Transmission</u>	Go to Step 4
	Attempt to establish communication with the engine control module (ECM).		Go to <u>Scan Tool Does Not Communicate</u>

4	Does the scan tool communicate with the ECM?	Go to Step 5	<u>with High Speed GMLAN Device</u>
5	Select the ECM DTCs function on the scan tool. Does the scan tool display any ECM DTCs?	Go to <u>Diagnostic Trouble Code (DTC) List - Vehicle</u>	Go to <u>Symptoms - Automatic Transmission</u>

DTC P0562 OR P0563: SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0562

System Voltage Low

DTC P0563

System Voltage High

Circuit/System Description

The transmission control module (TCM) continuously monitors the Battery Positive Voltage. Improper voltage may cause component damage or be inadequate to operate the transmission control solenoids properly. Improper solenoid operation may cause erratic transmission operation, which may result in internal damage.

Conditions for Running the DTC

- DTC P0717, P07C0, P07BF, U0100, or U0073 is not set.
- Engine speed is greater than 400 RPM for 2 seconds continuously.
- Input shaft speed is greater than 400 RPM for 2 seconds continuously.
- The transmission is not in limp home mode.

Conditions for Setting the DTC

P0562

The TCM detects that battery voltage is less than 9.0 volts for 20 seconds.

P0563

The TCM detects that battery voltage is greater than 18.0 volts for 20 seconds.

Action Taken When the DTC Sets

P0562

- DTC P0562 is a Type D DTC.
- The TCM allows the vehicle to be operated only in the third gear.

P0563

- DTC P0563 is a Type D DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

Conditions for Clearing the DTC

DTCs P0562 and P0563 are Type D DTCs.

Circuit/System Verification

Engine running, verify the transmission control module (TCM) scan tool control module voltage parameter is between 9.0-18.0 volts.

- If not within the specified range, refer to **Charging System Test** before performing Circuit/System Testing.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Ignition OFF, disconnect the harness connector at the K71 transmission control module (TCM).
2. Test for less than 1.0 ohm between ground circuit terminal 23 or 1 and ground.
 - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 6 and ground.
 - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the K71 TCM.
4. If all circuits test normal, replace the K71 TCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for TCM replacement, setup, and programming

DTC P057B-P057D: BRAKE PEDAL POSITION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Low Reference	-	5 V	-

Circuit/System Description

The brake pedal position (BPP) sensor is part of the engine brake pedal override feature. The engine control module (ECM) continuously monitors the vehicle speed and the position of the brake pedal. These two main inputs, along with other ECM inputs are used to determine if the vehicle is decelerating at the proper speed and rate with the brake pedal applied. When the engine brake pedal override system is active, the ECM reduces engine torque to assist in reducing vehicle speed.

The BPP sensor is a six wire sensor, and is part of a dual brake position sensor. One BPP Sensor is used for the stop lamps and the other BPP Sensor is used for the engine brake pedal override feature. The BPP Sensor for engine brake pedal override communicates with the ECM. The ECM supplies a 5 V reference circuit, low reference circuit, and signal circuit to the BPP sensor. The BPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage greater than 0.25 V when the brake pedal is released to a voltage less than 4.75 V when the brake pedal is fully applied.

For information on the Stop Lamps side of the BPP Sensor, refer to **Exterior Lighting Systems Description and Operation**.

Conditions for Running the DTC

- Ignition voltage is greater than 10 V.
- DTC runs continuously when above condition is met.

Conditions for Setting the DTC

P057B

The ECM detects that the BPP sensor signal is stuck in a range.

P057C

BPP sensor voltage is less than 0.25 V for 1 s.

P057D

BPP sensor voltage is greater than 4.75 V for 1 s.

Action Taken When the DTC Sets

- P057B, P057C, and P057D are Type A DTCs.
- Engine torque is reduced to 50% of available engine torque during brake torque management.
- Brake torque management is active at 25 kPa (3.7 PSI) of brake apply pressure.

Conditions for Clearing the DTC

P057B, P057C, and P057D are Type A DTCs

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0641, P0651, P0697, or P06A3 is not set.
 - **If any of the DTCs are set**

Refer to **Brake Pedal Position Sensor Learn**.

- **If none of the DTCs are set**
3. Transmission in Park, and service brake pedal released.
 4. Verify the scan tool Brake Pedal Position Sensor parameter in the ECM displays greater than 0.25 V.
 - **If 0.25 V or less**

Refer to Circuit/System Testing.

- **If greater than 0.25 V**
5. Verify the scan tool Brake Pedal Position Sensor parameter voltage changes as the brake pedal is applied and displays less than 4.75 V when the brake pedal is fully applied.
 - **If the voltage does not change, or is greater than 4.74 V**

Refer to Circuit/System Testing.

- **If the voltage changes and less than 4.75 V**
6. Verify the scan tool Brake Pedal Position Sensor Learned Release Position parameter is within 0.1 V of the Brake Pedal Position Sensor parameter when the brake pedal is fully released.
 - **If difference is greater than 0.1 V**

Perform the **Brake Pedal Position Sensor Learn**.

- **If difference is 0.1 V or less**
7. Verify the Brake Pedal Position Sensor parameter transitions smoothly without any spikes or dropouts when slowly applying and releasing the brake pedal.
 - **If parameter does not transition smoothly or has spikes or dropouts**

Refer to Circuit/System Testing.

- **If parameter transitions smoothly and there are no spikes or dropouts**
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 9. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

10. All OK.

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification first.

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor. It may take up to 2 minutes for all vehicle systems to power down.

NOTE: All terminal references are for the vehicle harness brake pedal position sensor connector.

2. Test for less than 10 ohms between the low reference circuit terminal 6 and ground.
 - **If 10 ohms or greater**
 1. Disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 5 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8-5.2 V**
5. Verify the scan tool Brake Pedal Position Sensor parameter is less than 0.25 V.
 - **If 0.25 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 0.25 V between the signal circuit terminal 4 and ground.

- If 0.25 V or greater, repair the short to voltage on the circuit.
- If less than 0.25 V, replace the K20 Engine Control Module.
- **If less than 0.25 V**
- 6. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 5.
- 7. Verify the scan tool Brake Pedal Position Sensor parameter is greater than 4.8 V.
 - **If 4.8 V or less**
 1. Ignition OFF, remove the jumper wire, and disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 4.8 V**
- 8. Replace the B22 Brake Pedal Position Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- Perform the **Brake Pedal Position Sensor Learn** following the replacement of the ECM or BPP sensor, or any repair that effects the BPP sensor alignment.
- **Brake Pedal Position Sensor Replacement**
- Refer to **Control Module References** for engine control module replacement, programming, and setup.

DTC P0601, P0602, P0604, OR P062F: CONTROL MODULE MEMORY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0601

Control Module Read Only Memory (ROM) Performance

DTC P0602

Control Module Not Programmed

DTC P0604

Control Module Random Access Memory (RAM) Performance

DTC P062F

Control Module Long Term Memory Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the transmission control module (TCM) system. This diagnostic also addresses if the TCM is not programmed.

Conditions for Running the DTC

The ignition is ON, or the engine is operating.

Conditions for Setting the DTC

P0601

The TCM detects that the checksum calculation does not match the expected checksum.

P0602

The TCM is identified as not programmed.

P0604

The TCM detects a random access memory (RAM) read/write error.

P062F

The TCM detects an incorrect copy of non-volatile memory.

Action Taken When the DTC Sets

P0601

- DTC P0601 is Type A DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

P0602

- DTC P0602 is Type C DTC.

- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

P0604

- DTC P0604 is Type B DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

P062F

- DTC P062F is a Type A DTC.
- The TCM uses the default value as the initial value for EEPROM.

Conditions for Clearing the DTC

P0601 and P062F

DTCs P0601 and P062F are Type A DTCs.

P0602

DTC P0602 is a Type C DTC.

P0604

DTC P0604 is a Type B DTC.

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. Verify that DTC P0602 does not fail this ignition cycle.
 - If DTC P0602 failed this ignition, reprogram the K71 TCM. Refer to **Control Module References** . If DTC P0602 resets, replace the K71 TCM.
2. Observe the DTC information with a scan tool. Verify that DTCs P0601, P0604, and P062F do not set this ignition cycle.
 - If any of the DTCs P0601, P0604, or P062F are set this ignition cycle, replace the K71 TCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Transmission Adaptive Learn**
- **Control Module References** for TCM replacement, setup, and programming

DTC P0705 OR P0706: TRANSMISSION RANGE (TR) SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0705

Transmission Range (TR) Switch Circuit Open

DTC P0706

Transmission Range (TR) Switch Circuit Short to Ground

Circuit/System Description

The transmission range (TR) switch is installed on the transmission case. The TR switch transmits the information which range includes the shift lever of the automatic transmission (A/T) to TCM by combination of a position circuit terminal. The TR switch input/output circuitry consists starter circuit (ST+, ST-), ground (GND) and position signal (P, R, N, D, 2, L). Each gear range position (P, R, N, D, 2, L) corresponds to a particular voltage (12 volts) within the TCM.

Conditions for Running the DTC

P0705

- The ignition is ON, or the engine is operating.
- The transmission is not in limp home mode.

P0706

- The ignition is ON, or the engine is operating.
- The transmission is not in limp home mode.

Conditions for Setting the DTC

P0705

The TCM detects that the TR switch circuit is open for 2 seconds.

P0706

The TCM detects that the TR switch circuit is shorted to ground for 5 seconds.

Action Taken When the DTC Sets

- DTCs P0705 and P0706 are Type B DTCs.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the third gear.

Conditions for Clearing the DTC

DTCs P0705 and P0706 are Type B DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool Transmission Range Switch parameter while slowly moving the gear shift lever from Park and through all ranges. Verify the gear shift lever position matches the scan tool parameter.

- If not within the specified value, adjust the shift control cable or the B81 park/neutral position switch.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector from K71 Transmission Control Module.
2. Inspect the resistance between each terminal of X2 harness connector and ground. Refer to Diagnostic Aids.
 - If not within the specified value, Inspect the wiring harness for short or open and replace it if needed.
3. Inspect the B81 park/neutral position switch. Refer to **Park/Neutral Position Switch Inspection**.
 - If not within the specified value, replace the B81 park/neutral position switch.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 - If the DTC resets, replace the K71 Transmission Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Park/Neutral Position Switch Replacement**
- **Transmission Adaptive Learn**
- Perform the **Control Module References** for TCM replacement, setup, and programming.

DTC P0711-P0713: TRANSMISSION FLUID TEMPERATURE (TFT) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0711

Transmission Fluid Temperature (TFT) Sensor Performance

DTC P0712

Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage

DTC P0713

Transmission Fluid Temperature (TFT) Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0712	P0713	P0713	P0711
Ground	-	P0713	P0713	P0711

Circuit/System Description

The transmission fluid temperature (TFT) sensor, which is integrated with the automatic transmission wiring harness, is installed on the front valve body. It directly detects the oil temperature within the hydraulic pressure control circuit and transmits a signal based on that temperature to the TCM. In response to changes in oil temperature, the TCM controls gear shifting for smooth shifting across a wide range of temperatures.

Conditions for Running the DTC

P0711

- DTC P0705 or P0706 is not set.
- The transmission is not in limp home mode.
- The transmission oil temperature is less than 20°C (68°F) at initialization.
- The transmission oil temperature is between -55 to +200°C (-67 to +392°F).
- The vehicle speed has been greater than 40 km/h (24 mph) at least once.

P0712

- Ignition ON.
- Battery voltage is between 10.2-18.0 volts.

P0713

- The transmission is not in limp home mode.

- The drive time is greater than 60 seconds.

Conditions for Setting the DTC

P0711

The automatic transmission fluid temperature is less than 20°C (68°F) after 10 minutes driving or more.

P0712

The automatic transmission fluid temperature is more than 200°C (392°F) for 10 seconds or more after consecutive 6 times.

P0713

The automatic transmission fluid temperature is lower than -55°C (-67°F) for 1 second or more after consecutive 12 times.

Action Taken When the DTC Sets

- DTC P0711, P0712, and P0713 are Type A DTCs.
- The TCM will default the transmission oil temperature to 80°C (176°F).
- No self learning control
- No lock-up slip control
- No neutral control

Conditions for Clearing the DTC

DTCs P0711, P0712, and P0713 are Type A DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Perform the **Transmission Fluid Level and Condition Check** to verify correct fluid level.
2. Engine idling at operating temperature, observe the scan tool Transmission Fluid Temperature parameter. The reading should be between -40 to +215°C (-40 to +488°F) and change.
3. Operate the vehicle at about 60 km/h (37 mph) for 10 min. Verify the scan tool Transmission Fluid Temperature parameter varies by more than 2°C (3.5°F) to verify that the sensor is not stuck.

Circuit/System Testing

Operate the vehicle within the conditions for running and setting the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Component Testing

Static Test

1. Ignition OFF, remove the K71 Transmission Control Module.
2. Ignition OFF, test for infinite resistance between the low reference circuit terminal 7 and ground.
 - If less than the specified range, replace the wiring harness.
3. Ignition OFF, test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than the specified range, replace the wiring harness.
4. Test for infinite resistance between each terminal and the low reference circuit terminal 7 and also to the signal circuit terminal 1.
 - If less than the specified range, replace the wiring harness.
5. Test for the resistance between the B13 transmission fluid temperature sensor signal circuit terminal 1 and the low reference circuit terminal 7. Refer to **Transmission Fluid Temperature Sensor Specifications** for the resistance values.
 - If not within the specified range, replace the wiring harness.
6. If the circuit test normal, replace the K71 Transmission Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Automatic Transmission Wiring Harness Replacement**
- **Transmission Adaptive Learn**
- **Control Module References** for TCM replacement, setup, and programming

DTC P0717, P07BF, OR P07C0: INPUT SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0717

Input Speed Sensor Circuit No Signal

DTC P07BF

Input Speed Sensor Circuit Low Voltage

DTC P07C0

Input Speed Sensor Circuit High Voltage

Circuit/System Description

The input speed sensor (ISS) is installed in the transmission case. The ISS detects the revolution speed of the intermediate shaft C2 drum (2) as the input shaft speed. These signals are transmitted to the TCM. Based on those signals, the TCM controls engine torque, shift timing, and lock-up.

Conditions for Running the DTC

P0717

- DTC P0705, P0706, P0722, P0748, P0778, P077C, P077D, P0798, P0962, P0963, P0966, P0967, P0970, P0971, P0973, or P0974 is not set.
- The output speed is 300 RPM or greater.
- The current gear is 2nd gear or greater.
- The transmission is not in limp home mode.
- The transmission range is D, 2, or L.

P07BF

- Ignition ON.
- Battery voltage is between 10.2-18.0 volts.

P07C0

- Ignition ON.
- Battery voltage is between 10.2-18.0 volts.

Conditions for Setting the DTC

P0717

The TCM detects no pulse signal from input speed sensor when there are 38 pulses from the output speed sensor, 500 occurrences.

P07BF

The voltage signal is less than 0.2 V for 100 msec over 10 times.

P07C0

The voltage signal is more than 2.7 V for 100 msec over 10 times.

Action Taken When the DTC Sets

- DTCs P0717, P07BF, and P07C0 are Type A DTCs.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

Conditions for Clearing the DTC

DTCs P0717, P07BF, and P07C0 are Type A DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine idling, observe the scan tool Transmission ISS parameter while varying the engine speed. The Transmission ISS parameter should change with the engine speed and not drop out.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the input speed sensor wiring harness.
2. Ignition ON, Test for 9-12 volts between the high and low signal circuits, from the TCM.
 - If not within the specified range, replace the K71 TCM.
3. If the circuits test normal, test or replace the B14C input speed sensor.

Component Testing

1. Test the input speed sensor wiring. There should not be an open, short to ground, or a short together condition.
 - If one of the above conditions is found, repair the circuit.
2. If all circuits test normal, replace the B14C input speed sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Input Speed Sensor Replacement**
- **Transmission Adaptive Learn**
- **Control Module References** for TCM replacement, setup, and programming

DTC P0722, P077C, OR P077D: OUTPUT SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0722

Output Speed Sensor Circuit No Signal

DTC P077C

Output Speed Sensor Circuit Low Voltage

DTC P077D

Output Speed Sensor Circuit High Voltage

Circuit/System Description

The output speed sensor (OSS) is installed in the transmission case. The OSS detects the revolution speed of the counter drive gear (4) as the output shaft speed. These signals are transmitted to the TCM. Based on those signals, the TCM controls engine torque, shift timing, and lock-up.

Conditions for Running the DTC

P0722

- DTC P0705, P0706, P0717, P07C0, P07BF, P0748, P0778, P0798, P0962, P0963, P0966, P0967, P0970, P0971, P0973, or P0974 is not set.
- The output speed is 300 RPM or greater.
- The transmission is not in limp home mode.
- The transmission range is D, 2, or L.

P077C

- Ignition ON.
- Battery voltage is between 10.2-18.0 volts.

P077D

- Ignition ON.
- Battery voltage is between 10.2-18.0 volts.

Conditions for Setting the DTC

P0722

The TCM detects no pulse signal from output speed sensor when there are 13 pulses from the input speed sensor, 500 occurrences.

P077C

Voltage signal is less than 0.2 V for 100 msec over 10 times.

P077D

Voltage signal is greater than 2.7 V for 100 msec over 10 times.

Action Taken When the DTC Sets

P0722

- DTC P0722 is a Type A DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the fourth gear.

P077C and P077D

- DTCs P077C and P077D are Type A DTCs.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

Conditions for Clearing the DTC

DTCs P0722, P077C, and P077D are Type A DTCs.

Scan Tool Reference

Control Module References for scan information.

Circuit/System Verification

1. Operate the vehicle at 16-32 km/h (10-20 mph) while observing the scan tool Transmission OSS parameter. The Transmission OSS should vary with the vehicle speed and not drop out.
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observe from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the output speed sensor wiring harness.
2. Ignition ON, Test for 9-12 volts between the high and low signal circuits, from TCM.
 - If not within the specified range, replace the K71 TCM.
3. If the circuits test normal, test or replace the B14A output speed sensor.

Component Testing

1. Test the output speed sensor wiring. There should not be an open, short to ground, or a short together condition.
 - If one of the above conditions is found, repair the circuit.
2. If all circuits test normal, replace the B14A output speed sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC P0731: 1ST GEAR RATIO

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0731

1st Gear Ratio Incorrect

Circuit/System Description

The pressure control solenoids (SLC1, SLC2) are installed on the front valve body. The solenoids linearly control hydraulic pressure in response to signals output from the transmission control module (TCM).

According to the combination of the pressure control solenoids (SLC1, SLC2), the transmission shifts from 1st gear into 4th gear and vice versa and line pressure control is done at the same time. As a fail-safe function, if any pressure control solenoid abnormality occurs, the TCM will disable the current to the solenoids.

The lock-up control solenoid (SLU) is installed on the valve body. It linearly controls lock-up clutch hydraulic pressure based on engine RPM, throttle opening degree signals, input speed sensor signals, and output speed sensor signals. This results in control of lock-up. As a fail-safe function, if any abnormality occurs in the lock-up control solenoid (SLU), then the TCM will shut off the current to the solenoid.

Conditions for Running the DTC

- The transmission range is D, 2, or L.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The current gear is 1st gear with engine brake.
- The output speed is greater than 500 RPM.
- The engine torque is more than 0 (0 lb ft).

Conditions for Setting the DTC

- Calculation of actual gear ratio for 1st gear with engine brake is not correct.
- (Output shaft speed times current gear ratio) minus input shaft speed is greater than 400 RPM for 1 second after consecutive 5 times.

Action Taken When the DTC Sets

- DTC P0731 is a Type D DTC.
- No self learning control
- No up slope mode

Conditions for Clearing the DTC

DTC P0731 is a Type D DTC.

Diagnostic Aids

Ensure the transmission fluid level, color and odor is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

DTC P0741 OR P0742: TORQUE CONVERTER CLUTCH (TCC)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0741

Torque Converter Clutch (TCC) System Stuck Off

DTC P0742

Torque Converter Clutch (TCC) System Stuck On

Diagnostic Fault Information

Component	Condition	DTCs
Valve Body Assembly	• Incorrect transmission fluid level • Clogged hydraulic system • Plugged or restricted passages	P0741, P0742

	• Gasket leaking	
Torque Converter	• Incorrect transmission fluid level • Clogged hydraulic system • Mechanically stuck in the applied position • Gasket leaking	P0741, P0742

Circuit/System Description

The transmission control module (TCM) controls the torque converter clutch (TCC) lock up pressure control solenoid valve. The solenoid directs the hydraulic fluid for TCC apply and release. When the TCC is released, the engine is coupled by fluid to the transmission.

Conditions for Running the DTC

P0741

- DTC P0973, P0974, P2761, P2763, or P2764 is not set.
- The transmission range is D, 2, or L.
- Range equals D, 2, or L for 8 seconds.
- Engine torque is more than 0 (0 lb ft).
- The engine speed is less than 4000 RPM.
- Transmission oil temperature is 20°C (68°F) or greater.

P0742

- DTC P0973, P0974, P2761, P2763, or P2764 is not set.
- The transmission range is D, 2, or L.
- Range equals D, 2, or L for 8 seconds.
- Engine torque is more than 60 (44 lb ft).
- The engine speed is between 1000-3000 RPM.
- Transmission oil temperature is 20°C (68°F) or greater.

Conditions for Setting the DTC

P0741

Engine speed minus input speed is more than 100 RPM for 2 seconds after consecutive 6 times.

P0742

Engine speed minus input speed is less than 30 RPM for 2 seconds after consecutive 2 times.

Action Taken When the DTC Sets

P0741

- DTC P0741 is a Type B DTC.
- No self learning control.
- No lock-up control.
- No lock-up slip control.

P0742

- DTC P0742 is a Type C DTC.
- No self learning control.
- No up slip control.

Conditions for Clearing the DTC

- DTC P0741 is a Type B DTC.
- DTC P0742 is a Type C DTC.

Diagnostic Aids

Ensure the transmission fluid level, color and odor is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

Circuit/System Verification

Operate the vehicle in drive with the calculated throttle position greater than 8% and ensure TCC is commanded ON and OFF a minimum of 5 times.

- Verify the DTC does not reset. If the DTC resets and no other DTC is set, go to Circuit/System Testing.
- If any other DTC is set, diagnose that DTC first.

Circuit/System Testing

1. Perform the line pressure check. Refer to **Line Pressure Check**.
2. Perform the transmission fluid check. Refer to **Transmission Fluid Level and Condition Check**.
3. Test the shift solenoid valve for 11-15 ohms at 20°C (68°F).
 - If not within the specified range, replace the Q32A shift solenoid valve 1.
4. Remove the control valve body and test the Q39A TCC control solenoid valve (SLU) for 5.0-5.6 ohms at 20°C (68°F).
 - If not within the specified range, replace the control valve body.
5. If all circuits and components test normal, replace the transmission.

Component Testing

1. Test the Q32A shift solenoid valve 1, at 20°C (68°F), for 11-15 ohms across the solenoid.
 - If not within the specified range, replace the Q32A shift solenoid valve 1.
2. Test the Q39A TCC control solenoid valve (SLU), at 20°C (68°F), for 5.0-5.6 ohms across the solenoid.
 - If not within the specified range, replace the control valve body.
3. Inspect the torque converter assembly for damage or discoloration.
 - If you find a torque converter assembly concern, replace the torque converter assembly as necessary.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **1-2 Shift Solenoid Valve Replacement**
- **Control Valve Body Replacement**
- **Transmission Replacement**
- **Transmission Adaptive Learn**
- **Control Module References** for TCM replacement, setup, and programming

DTC P0746 OR P0747: PRESSURE CONTROL SOLENOID VALVE 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0746

Pressure Control Solenoid Valve 1 Stuck Off

DTC P0747

Pressure Control Solenoid Valve 1 Stuck On

Circuit/System Description

C1 pressure control solenoid (SLC1) is part of the valve body. SLC1 linearly control hydraulic pressure in response to signals output from the transmission control module (TCM), and the C1 clutch is controlled directly. Through this, it controls operating hydraulic pressure to the clutch and brakes for smooth shifting. According to the combination of other pressure control solenoids (SLC2, SLB1), the transmission shifts from 1st gear into 4th gear and vice versa and line pressure control is done at the same time. As a fail-safe function, if any pressure control solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Conditions for Running the DTC

P0746

Fail Case 1

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 2nd or 3rd gear.
- The output speed is 500 RPM or greater.

Fail Case 2

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 4th gear.

- The output speed is 250 RPM or greater.
- The engine torque is more than 60 (44 lb ft).

Fail Case 3

- The transmission is not in limp home mode.
- The transmission oil temperature is 0°C (32°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 1st, 2nd, or 3rd gear.
- The current lock up is OFF.
- Engine speed minus input speed is less than 150 RPM.
- Input speed is greater than output speed times 1st gear ratio plus 400 RPM.
- The output speed is 500 RPM or less.

P0747

Fail Case 1

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The output speed is greater than 300 RPM.
- The command pressure to engage is greater than 245 kpa (36 psi).
- The estimated turbine torque is more than 30 (22 lb ft) or less than -20 (-15 lb ft).

Fail Case 2 and 3

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The output speed is greater than 250 RPM.
- The current gear is 4th gear.
- The estimated turbine torque is more than 30 (22 lb ft) or less than -20 (-15 lb ft).

Conditions for Setting the DTC

P0746

Fail Case 1

- Calculation of actual gear ratio for current gear (2nd or 3rd) is not correct.
- Input shaft speed minus output shaft speed times current gear ratio is greater than 400 RPM for 1 second

after consecutive 5 times.

Fail Case 2

- Calculation of actual gear ratio for 4th gear is correct.
- Input shaft speed minus output shaft speed times current gear ratio is less than 115 RPM for 1 second after consecutive 5 times.

Fail Case 3

- Calculation of actual gear ratio for current gear (1st, 2nd, or 3rd) is not correct.
- The time is different by difference between actual gear ratio and current gear ratio.

P0747

Fail Case 1

- The beginning of 2-4 or 3-4 shift is not detected.
- The Input speed change does not occur.

Fail Case 2

- Calculation of actual gear ratio for 4th gear is not correct.
- Input shaft speed minus output shaft speed times 2nd gear ratio is less than 230 RPM for 0.5 second after consecutive 5 times.

Fail Case 3

- Calculation of actual gear ratio for 4th gear is not correct.
- Input shaft speed minus output shaft speed times 3rd gear ratio is less than 150 RPM for 0.5 second after consecutive 5 times.

Action Taken When the DTC Sets

P0746

- DTC P0746 is a Type B DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second or fourth gear.

P0747

- DTC P0747 is a Type B DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

Conditions for Clearing the DTC

DTCs P0746 and P0747 are Type B DTCs.

Circuit/System Verification

Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. Ignition ON, observe the DTC information with a scan tool.

Circuit/System Testing

1. Perform the line pressure check. Refer to **Line Pressure Check**.
2. Perform the transmission fluid check. Refer to **Transmission Fluid Level and Condition Check**.
3. Remove the control valve body and test the Q27A pressure control solenoid valve 1 (SLC1) for 5.0-5.6 ohms at 20°C (68°F).
 - If not within the specified range, replace the control valve body.

4. If all circuits and components test normal, replace the transmission.

Component Testing

Test the Q27A pressure control solenoid valve 1 (SLC1), at 20°C (68°F), for 5.0-5.6 ohms across the solenoid.

- If not within the specified range, replace the control valve body.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Control Valve Body Replacement**
- **Transmission Replacement**
- **Transmission Adaptive Learn**
- **Control Module References** for TCM replacement, setup and programming

DTC P0748, P0962, OR P0963: PRESSURE CONTROL SOLENOID VALVE 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0748

Pressure Control Solenoid Valve 1 Control Circuit

DTC P0962

Pressure Control Solenoid Valve 1 Control Circuit Low Voltage

DTC P0963

Pressure Control Solenoid Valve 1 Control Circuit High Voltage

Circuit/System Description

C1 pressure control solenoid (SLC1) is part of the valve body. SLC1 linearly controls hydraulic pressure in response to signals output from the transmission control module (TCM), and the C1 clutch is controlled directly. Through this, it controls operating hydraulic pressure to the clutch and brakes for smooth shifting.

According to the combination of other pressure control solenoids (SLC2, SLB1), the transmission shifts from

1st gear into 4th gear and vice versa and line pressure control is done at the same time.

As a fail-safe function, if any pressure control solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Conditions for Running the DTC

P0748

- The battery voltage is greater than 10.5 volts for 500 msec.
- The feedback current is less than 1358 mA.
- The transmission is not in limp home mode.
- DTC P0962 or P0963 is not set.

P0962

The transmission is not in limp home mode.

P0963

The transmission is not in limp home mode.

Conditions for Setting the DTC

P0748

Deviation between commanded current and feedback current.

P0962

The TCM detects at least 5 times less than 20 mA current consumption of the SLC1 control circuit for 100 msec.

P0963

The TCM detects at least 5 times more than 1358 mA current consumption of the SLC1 control circuit for 100 msec.

Action Taken When the DTC Sets

P0748 and P0962

- DTC P0748 and P0962 are Type A DTCs.
- The TCM allows the vehicle to be operated only in the third gear.

P0963

- DTC P0963 is a Type A DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

Conditions for Clearing the DTC

DTCs P0748, P0962, and P0963 are Type A DTCs.

Diagnostic Aids

When attempting to set solenoid electrical DTCs, ensure the TCM is warmed up and the transmission is operated in 2nd gear long enough to ensure a 3°C (5°F) increase in TCM substrate temperature. This will place the TCM under the optimal conditions to test solenoid electrical DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ensure the transmission fluid temperature is between 50-80°C (122-176°F).

2. Operate the vehicle in 2nd gear long enough to ensure at least a 3°C (5°F) rise in transmission fluid temperature, then operate the vehicle in Park for 5 s.
3. Observe the scan tool Pressure Control Solenoid Valve 1 Current parameter, the reading should be between 0.1-1.1 A.
 - If the parameter is not within specified range or if the DTC resets, go to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the automatic transmission (AT) wiring harness at the transmission.
2. Test for 5.0-5.6 ohms at 20°C (68°F) between the low reference circuit terminal 13 and the voltage supply circuit terminal 6.
 - If not within the specified range, remove the control valve body to test the Q27A pressure control solenoid valve 1 (SLC1).
3. Inspect the Q27A pressure control solenoid valve 1 (SLC1) for 5.0-5.6 ohms at 20°C (68°F).
 - If not within the specified range, replace the control valve body.
 - If within the specified range, replace the AT wiring harness.
4. If all circuits test normal, replace the K71 Transmission Control Module.

Component Testing

Test the Q27A pressure control solenoid valve 1 (SLC1), at 20°C (68°F), for 5.0-5.6 ohms across the solenoid.

- If not within the specified range, replace the control valve body.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Control Valve Body Replacement**
- **Transmission Adaptive Learn**

DTC P0751: SHIFT SOLENOID VALVE 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0751

Shift Solenoid Valve 1 Performance - Stuck Off

Circuit/System Description

Shift solenoid (SS) valve 1 turns ON and OFF in response to signals output from the TCM. According to ON or OFF status of SS valve 1, the 1st gear engine brake operates or manual shift mode occurs. As a fail-safe function, if any shift solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Conditions for Running the DTC

- The transmission range is D, 2, or L.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The current gear is 1st gear with engine brake.
- The output speed is 250 RPM or greater.
- The engine torque is 60 (44 lb ft) or greater.
- The input speed is 6000 RPM or less.

Conditions for Setting the DTC

- Calculation of actual gear ratio for 1st gear with engine brake is not correct.
- Input shaft speed minus (output shaft speed times 3rd gear ratio) is less than 150 RPM for 1 second after consecutive 5 times.

Action Taken When the DTC Sets

- DTC P0751 is a Type C DTC.
- No self learning control
- No up slope mode
- To be operated in the second gear when 1st gear with engine brake condition (via L or I range) is required.

Conditions for Clearing the DTC

P0751

DTC P0751 is a Type C DTC.

Diagnostic Aids

Ensure the transmission fluid level, color and odor is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

DTC P0776 OR P0777: PRESSURE CONTROL SOLENOID VALVE 2

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0776

Pressure Control Solenoid Valve 2 Stuck Off

DTC P0777

Pressure Control Solenoid Valve 2 Stuck On

Circuit/System Description

C2 pressure control solenoid (SLC2) is part of the valve body. SLC2 linearly controls hydraulic pressure in response to signals output from the transmission control module (TCM), and the C2 clutch is controlled directly. Through this, it controls operating hydraulic pressure to the clutch and brakes for smooth shifting. According to the combination of other pressure control solenoids (SLC1, SLB1), the transmission shifts from 1st gear into 4th gear and vice versa and line pressure control is done at the same time.

As a fail-safe function, if any pressure control solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Shift solenoid (SS) valve 1 turns ON and OFF in response to signals output from the TCM. According to ON or OFF status of SS valve 1, the 1st gear engine brake operates or manual shift mode occurs. As a fail-safe function, if any shift solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Conditions for Running the DTC

P0776

Fail Case 1

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.

- The transmission range is D, 2, or L.
- The current gear is 3rd or 4th gear.
- The output speed is 500 RPM or greater.

Fail Case 2

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 2nd gear.
- The output speed is 250 RPM or greater.
- The engine torque is 60 (44 lb ft) or greater.

Fail Case 3

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 1st gear.
- The output speed is 250 RPM or greater.
- The engine torque is 60 (44 lb ft) or greater.
- The input speed is 6000 RPM or less.

P0777

Fail Case 1

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The output speed is greater than 300 RPM.
- The command pressure to engage is greater than 196 kpa (28 psi).
- The estimated turbine torque is more than 30 (22 lb ft) or less than -20 (-15 lb ft).

Fail Case 2

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The output speed is greater than 300 RPM.
- When the estimated turbine torque without inertia is less than 40 (30 lb ft), the command pressure to

engage is greater than 294 kpa (43 psi).

- When the estimated turbine torque without inertia is greater than 40 (30 lb ft), the command pressure to engage is greater than 196 kpa (28 psi).
- The estimated turbine torque is more than 30 (22 lb ft) or less than -20 (-15 lb ft).

Fail Case 3

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 1st gear.
- The output speed is 250 RPM or greater.
- The engine torque is 60 (44 lb ft) or greater.
- Input speed is 6000 RPM or less.

Fail Case 4 and 5

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The output speed is 250 RPM or greater.
- The current gear is 2nd gear.
- The estimated turbine torque is more than 30 (22 lb ft) or less than -20 (-15 lb ft).

Conditions for Setting the DTC

P0776

Fail Case 1

- Calculation of actual gear ratio for current gear (3rd or 4th) is not correct.
- Input shaft speed minus output shaft speed times current gear ratio is greater than 400 RPM for 1 second after consecutive 5 times.

Fail Case 2

- Calculation of actual gear ratio for 2nd gear is correct.
- Input shaft speed minus output shaft speed times current gear ratio is less than 230 RPM for 1 second after consecutive 5 times.

Fail Case 3

- Calculation of actual gear ratio for 1st gear is correct.

- Input shaft speed minus output shaft speed times current gear ratio is less than 400 RPM for 1 second after consecutive 5 times.

P0777

Fail Case 1

- The beginning of 1-2 shift is not detected.
- The input speed change does not occur.

Fail Case 2

- The beginning of 3-2 or 4-2 shift is not detected.
- The input speed change does not occur.

Fail Case 3

- Calculation of actual gear ratio for 1st gear is not correct.
- Input shaft speed minus output shaft speed times 3rd gear ratio is less than 150 RPM for 1 second after consecutive 5 times.

Fail Case 4

- Calculation of actual gear ratio for 2nd gear is not correct.
- Input shaft speed minus output shaft speed times 3rd gear ratio is less than 150 RPM for 0.5 second after consecutive 5 times.

Fail Case 5

- Calculation of actual gear ratio for 2nd gear is not correct.
- Input shaft speed minus output shaft speed times 4th gear ratio is less than 115 RPM for 0.5 second after consecutive 5 times.

Action Taken When the DTC Sets

P0776

- DTC P0776 is a Type B DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

P0777

- DTC P0777 is a Type B DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the third gear.

Conditions for Clearing the DTC

DTCs P0776 and P0777 are Type B DTCs.

Circuit/System Verification

Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. Ignition ON, observe the DTC information with a scan tool.

Circuit/System Testing

Dynamic Test

1. Perform the line pressure check. Refer to **Line Pressure Check**.
2. Perform the transmission fluid check. Refer to **Transmission Fluid Level and Condition Check**.

3. Test the Q32A shift solenoid valve for 11-15 ohms at 20°C (68°F).
 - If not within the specified range, replace the Q32A shift solenoid valve.
4. Remove the control valve body and test the Q27B pressure control solenoid valve 2 (SLC2) for 5.0-5.6 ohms at 20°C (68°F).
 - If not within the specified range, replace the control valve body.
5. If all circuits and components test normal, replace the transmission.

Component Testing

Shift Solenoid

Test the Q32A shift solenoid valve, at 20°C (68°F), for 11-15 ohms across the solenoid.

- If not within the specified range, replace the Q32A shift solenoid valve.

Pressure Control Solenoid (SLC2)

Test the Q27B pressure control solenoid valve 2 (SLC2), at 20°C (68°F), for 5.0-5.6 ohms across the solenoid.

- If not within the specified range, replace the control valve body.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC P0778, P0966, OR P0967: PRESSURE CONTROL SOLENOID VALVE 2

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0778

Pressure Control Solenoid Valve 2 Control Circuit

DTC P0966

Pressure Control Solenoid Valve 2 Control Circuit Low Voltage

DTC P0967

Pressure Control Solenoid Valve 2 Control Circuit High Voltage

Circuit/System Description

C2 pressure control solenoid (SLC2) is part of the valve body. SLC2 linearly controls hydraulic pressure in response to signals output from the transmission control module (TCM), and the C2 clutch is controlled directly. Through this, it controls operating hydraulic pressure to the clutch and brakes for smooth shifting. According to the combination of other pressure control solenoids (SLC1, SLB1), the transmission shifts from 1st gear into 4th gear and vice versa and line pressure control is done at the same time.

As a fail-safe function, if any pressure control solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Conditions for Running the DTC

P0778

- The battery voltage is greater than 10.5 volts for 500 msec.
- The feedback current is less than 1358 mA.
- The transmission is not in limp home mode.
- DTC P0966 or P0967 is not set.

P0966

The transmission is not in limp home mode.

P0967

The transmission is not in limp home mode.

Conditions for Setting the DTC

P0778

Deviation between commanded current and feedback current.

P0966

The TCM detects at least 5 times less than 20 mA current consumption of the SLC2 control circuit for 100 msec.

P0967

The TCM detects at least 5 times more than 1358 mA current consumption of the SLC2 control circuit for 100 msec.

Action Taken When the DTC Sets

P0778 and P0966

- DTCs P0778 and P0966 are Type A DTCs.
- The TCM allows the vehicle to be operated only in the third gear.

P0967

- DTC P0967 is a Type A DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second or third gear.

Conditions for Clearing the DTC

DTCs P0778, P0966, and P0967 are Type A DTCs.

DTC Descriptors

DTC P0796

Pressure Control Solenoid Valve 3 Stuck Off

DTC P0797

Pressure Control Solenoid Valve 3 Stuck On

Circuit/System Description

B1 pressure control solenoid (SLB1) is part of the valve body. SLB1 linearly controls hydraulic pressure in response to signals output from the transmission control module (TCM), and the B1 brake is controlled directly. Through this, it controls operating hydraulic pressure to the clutch and brakes for smooth shifting. According to the combination of other pressure control solenoids (SLC1, SLB1), the transmission shifts from 1st gear into 4th gear and vice versa and line pressure control is done at the same time.

As a fail-safe function, if any pressure control solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Conditions for Running the DTC

P0796

Fail Case 1

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 2nd or 4th gear.
- The output speed is 500 RPM or greater.

Fail Case 2

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 3rd gear.
- The output speed is 250 RPM or greater.
- The engine torque is 60 (44 lb ft) or greater.

Fail Case 3

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 1st gear.
- The output speed is 250 RPM or greater.
- The engine torque is 60 (44 lb ft) or greater.
- The input speed is 6000 RPM or less.

P0797

Fail Case 1

- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The output speed is greater than 300 RPM.
- The command pressure to engage is greater than 196 kpa (28 psi).
- The estimated turbine torque is more than 30 (22 lb ft) or less than -20 (-15 lb ft).

Fail Case 2

- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The output speed is greater than 300 RPM.
- The command pressure to engage is greater than 245 kpa (36 psi).
- The estimated turbine torque is more than 30 (22 lb ft) or less than -20 (-15 lb ft).

Fail Case 3

- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The output speed is greater than 300 RPM.
- The engine torque is 60 (44 lb ft) or greater.
- When the estimated turbine torque without inertia is less than 40 (30 lb ft), the command pressure to engage is greater than 294 kpa (43 psi).
- When the estimated turbine torque without inertia is greater than 40 (30 lb ft), the command pressure to engage is greater than 196 kpa (28 psi).
- The estimated turbine torque is more than 30 (22 lb ft) or less than - 20 (-15 lb ft).

Fail Case 4

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 1st gear with engine brake.
- The output speed is 250 RPM or greater.
- The engine torque is 60 (44 lb ft) or greater.
- Input speed is 6000 RPM or less.

Fail Case 5

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 1st gear.
- The output speed is 250 RPM or greater.
- The engine torque is 60 (44 lb ft) or greater.
- Input speed is 6000 RPM or less.

Fail Case 6 and 7

- The transmission is not in limp home mode.
- The transmission oil temperature is -20°C (-4°F) or greater.
- The transmission range is D, 2, or L.
- The current gear is 3rd gear.
- The output speed is 250 RPM or greater.
- The estimated turbine torque is more than 30 (22 lb ft) or less than -20 (-15 lb ft).

Conditions for Setting the DTC

P0796

Fail Case 1

- Calculation of actual gear ratio for current gear (2nd or 4th) is not correct.
- Input shaft speed minus output shaft speed times current gear ratio is greater than 400 RPM for 1 second after consecutive 5 times.

Fail Case 2

- Calculation of actual gear ratio for 3rd gear is correct.
- Input shaft speed minus output shaft speed times current gear ratio is less than 150 RPM for 1 second after consecutive 5 times.

Fail Case 3

- Calculation of actual gear ratio for 1st gear is correct.
- Input shaft speed minus output shaft speed times current gear ratio is less than 400 RPM for 1 second after consecutive 5 times.

P0797

Fail Case 1

- The beginning of 1-3 shift is not detected.
- The input speed change does not occur.

Fail Case 2

- The beginning of 2-3 shift is not detected.
- The input speed change does not occur.

Fail Case 3

- The beginning of 4-3 shift is not detected.
- The input speed change does not occur.

Fail Case 4

- Calculation of actual gear ratio for 1st gear with engine brake is not correct.
- Input shaft speed minus output shaft speed times 2nd gear ratio is less than 230 RPM for 0.5 second after consecutive 5 times.

Fail Case 5

- Calculation of actual gear ratio for 1st gear is not correct.
- Input shaft speed minus output shaft speed times 2nd gear ratio is less than 230 RPM for 1 second after consecutive 5 times.

Fail Case 6

- Calculation of actual gear ratio for 3rd gear is not correct.
- Input shaft speed minus output shaft speed times 2nd gear ratio is less than 230 RPM for 0.5 second after consecutive 5 times.

Fail Case 7

- Calculation of actual gear ratio for 3rd gear is not correct.
- Input shaft speed minus output shaft speed times 4th gear ratio is less than 115 RPM for 0.5 second after

consecutive 5 times.

Action Taken When the DTC Sets

P0796

- DTC P0796 is a Type B DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the third gear.

P0797

- DTC P0797 is a Type B DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

Conditions for Clearing the DTC

DTCs P0796 and P0797 are Type B DTCs.

Circuit/System Verification

Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. Ignition ON, observe the DTC information with a scan tool.

Circuit/System Testing

1. Perform the line pressure check. Refer to **Line Pressure Check**.
2. Perform the transmission fluid check. Refer to **Transmission Fluid Level and Condition Check**.
3. Remove the control valve body and test the Q27C pressure control solenoid valve (SLB1) for 5.0-5.6 ohms at 20°C (68°F).
 - If not within the specified range, replace the control valve body.
4. If all circuits and components test normal, replace the transmission.

Component Testing

Test the Q27C pressure control solenoid valve (SLB1), at 20°C (68°F), for 5.0-5.6 ohms across the solenoid.

- If not within the specified range, replace the control valve body.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Control Valve Body Replacement**
- **Transmission Replacement**

DTC P0798, P0970, OR P0971: PRESSURE CONTROL SOLENOID VALVE 3

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0798

Pressure Control Solenoid Valve 3 Control Circuit

DTC P0970

Pressure Control Solenoid Valve 3 Control Circuit Low Voltage

DTC P0971

Pressure Control Solenoid Valve 3 Control Circuit High Voltage

Circuit/System Description

B1 pressure control solenoid (SLB1) is part of the valve body. SLB1 linearly controls hydraulic pressure in response to signals output from the transmission control module (TCM), and the B1 brake is controlled directly. Through this, it controls operating hydraulic pressure to the clutch and brakes for smooth shifting. According to the combination of other pressure control solenoids (SLC1, SLB1), the transmission shifts from 1st gear into 4th gear and vice versa and line pressure control is done at the same time. As a fail-safe function, if any pressure control solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Conditions for Running the DTC

P0798

- The battery voltage is greater than 10.5 volts for 500 msec.
- The feedback current is less than 1358 mA.
- The transmission is not in limp home mode.
- DTCs P0970 and P0971 are not set.

P0970

The transmission is not in limp home mode.

P0971

The transmission is not in limp home mode.

Conditions for Setting the DTC

P0798

Deviation between commanded current and feedback current.

P0970

The TCM detects at least 5 times less than 20 mA current consumption of the SLB1 control circuit for 100 msec..

P0971

The TCM detects at least 5 times more than 1358 mA current consumption of the SLB1 control circuit for 100 msec.

Action Taken When the DTC Sets

P0798 and P0970

- DTCs P0798 and P0970 are Type A DTCs.
- The TCM allows the vehicle to be operated only in the third gear.

P0971

- DTC P0971 is a Type A DTC.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second or third gear.

Conditions for Clearing the DTC

DTCs P0798, P0970, and P0971 are Type A DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ensure the transmission fluid temperature is between 50-80°C (122-176°F).
2. Operate the vehicle in 2nd gear long enough to ensure at least a 3°C (5°F) rise in transmission fluid temperature, then operate the vehicle in Park for 5 s.
3. Observe the scan tool Clutch Pressure Control Solenoid Valve 3 Current parameter, the reading should be between 0.1-1.1 A.
 - If the parameter is not within specified range or if the DTC resets, go to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the automatic transmission (AT) wiring harness at the transmission.
2. Test for 5.0-5.6 ohms at 20°C (68°F) between the low reference circuit terminal 11 and the voltage supply circuit terminal 4.
 - If not within the specified range, remove the control valve body to test the Q27C pressure control solenoid valve 3 (SLB1).
3. Inspect the Q27C pressure control solenoid valve 3 (SLB1) for 5.0-5.6 ohms at 20°C (68°F).
 - If not within the specified range, replace the control valve body.
 - If within the specified range, replace the AT wiring harness.
4. If all circuits test normal, replace the K71 Transmission Control Module.

Component Testing

Test the Q27C pressure control solenoid valve 3 (SLB1), at 20°C (68°F), for 5.0-5.6 ohms across the solenoid.

- If not within the specified range, replace the control valve body.

DTC P0851 OR P0852: PARK/NEUTRAL POSITION SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0851

Park/Neutral Position Switch Circuit Low Voltage

DTC P0852

Park/Neutral Position Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0851	P0852	P0852	-

Typical Scan Tool Data

Park/Neutral Position Switch

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature			
Parameter Normal Range: 12 Volts = In-Gear, 0 Volts = Park/Neutral			
Park/Neutral Signal	Park/Neutral	In-Gear	In-Gear

Circuit/System Description

The transmission range (TR) switch, also known as the park/neutral position (PNP) switch, is installed on the transmission case. The TR switch sends the transmission gear range information to the TCM by combination of position circuit terminal inputs. The Park/Neutral Signal is also sent from the park/neutral switch directly to the engine control module (ECM) and is used for engine start enable.

Conditions for Running the DTC

- Ignition voltage is between 11-18 volts.
- No VSS faults exist.
- No communication faults between TCM and ECM.

Conditions for Setting the DTC

P0851

The ECM detects the gear is in park or neutral while the gear position is indicated to be In-Gear.

P0852

The ECM detects the gear is not in park or neutral while the gear position from TCM is park or neutral.

Action Taken When the DTC Sets

DTCs P0851 and P0852 are Type C DTCs.

Conditions for Clearing the DTC

DTCs P0851 and P0852 are Type C DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. If there are any other transmission related DTCs set, diagnose those DTCs first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Ignition ON.

3. Verify the scan tool Park/Neutral Position Switch parameter in the ECM data list changes between Park/Neutral and In-Gear when moving the gear shift lever from Park, to Reverse and through all the ranges.

- **If the parameter does not change**

Refer to Circuit/System Testing.

- **If the parameter changes**

4. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B81 Park/Neutral Position Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Park/Neutral Position Switch parameter is In-Gear.
 - **If not In-Gear**
 1. Ignition OFF, disconnect the X1 harness connector at the K20 ECM.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 ECM.
 - **If In-Gear**
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the ground circuit terminal 1.
6. Verify the scan tool Park/Neutral Position Switch parameter is Park/Neutral.
 - **If not Park/Neutral**
 1. Ignition OFF, disconnect the X1 harness connector at the K20 ECM, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 ECM.
 - **If Park/Neutral**

7. Test or replace the B81 Park/Neutral Position Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Park/Neutral Position Switch Replacement**
- **Control Module References** for ECM replacement, setup, and programming

DTC P0973 OR P0974: SHIFT SOLENOID VALVE 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0973

Shift Solenoid Valve 1 Control Circuit Low Voltage

DTC P0974

Shift Solenoid Valve 1 Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Shift Solenoid Valve 1 Control	P0973	P0974	P0974	-

Circuit/System Description

Shift solenoid (SS) valve 1 turns ON and OFF in response to signals output from the TCM. According to ON or OFF status of SS valve 1, the 1st gear engine brake operates or manual shift mode occurs. As a fail-safe function, if any shift solenoid abnormality occurs, the TCM will disable the current to the solenoids.

Conditions for Running the DTC

P0973

- Solenoid valve 1 driver outputs ON signal.
- The transmission is not in limp home mode.
- The time after the command of shift solenoid (S1) changed is 10 msec.

P0974

- Solenoid valve 1 driver outputs OFF signal.
- The transmission is not in limp home mode.
- The time after the command of shift solenoid (S1) changed is 10 msec.

Conditions for Setting the DTC

P0973

The TCM detects an OFF signal of the Shift Solenoid Valve 1 circuit when the Shift Solenoid Valve 1 is commanded ON for 100 msec continuously after 5 times.

P0974

The TCM detects an ON signal of the Shift Solenoid Valve 1 circuit when the Shift Solenoid Valve 1 is commanded OFF for 100 msec continuously after 5 times.

Action Taken When the DTC Sets

- DTCs P0973 and P0974 are Type A DTCs.
- The TCM allows the vehicle after below 10 km/h (6 mph) to be operated only in the second gear.

Conditions for Clearing the DTC

DTCs P0973 and P0974 are Type A DTCs.

Diagnostic Aids

When attempting to set solenoid electrical DTCs, ensure the control solenoid valve assembly is warmed up and the transmission is operated long enough to ensure a 3°C (5°F) increase in temperature. This will place the TCM in the optimal conditions to test solenoid electrical DTCs.

Circuit/System Verification

1. Ensure the transmission fluid temperature is between 50-80°C (122-176°F).
2. Operate the vehicle in 2nd gear long enough to ensure at least a 3°C (5°F) rise in oil temperature.
3. Place the gear selector in Reverse for 5 s and then idle vehicle for 5 s.
4. Observe the scan tool data Shift Solenoid Valve 1 parameter. The parameter should display ON.

Circuit/System Testing

1. Ignition OFF, disconnect the automatic transmission (AT) wiring harness at the transmission.
2. Test for 11-15 ohms at 20°C (68°F) between the shift solenoid control circuit terminal 10 and ground.
 - If not within the specified range, test the wiring harness for internal short, or interruption. If the circuit test normal, replace the Q32A shift solenoid valve 1.
3. Test for infinite resistance between each terminal and the shift solenoid control circuit terminal 10.
 - If less than the specified range, replace the wiring harness.
4. If all circuits test normal, test the Q32A shift solenoid valve 1 and replace it if the malfunction is found. Verify the DTC does not reset.
 - If the DTC resets, replace the K71 Transmission Control Module.

Repair Instructions

DTC P2534: IGNITION ON/START SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P2534

Ignition On/Start Switch Circuit Low Voltage

Circuit/System Description

The transmission control module (TCM) continuously monitors the ignition voltage circuit. A low ignition voltage reading at the TCM will cause DTC P2534 to set.

Conditions for Running the DTC

- DTC U0073 or U0100 is not set
- Battery Voltage is 9.0 volts or greater.
- Engine running is ON.
- TCM can receive frame ECM
- TCM does not receive "BUS OFF" state from CAN controller.

Conditions for Setting the DTC

The TCM detects that ignition voltage is less than 0.2 times battery voltage for 20 seconds.

Action Taken When the DTC Sets

- DTC P2534 is a Type A DTC.
- The TCM allows the vehicle to be operated only in the third gear.

Conditions for Clearing the DTC

DTC P2534 is a Type A DTC.

Diagnostic Aids

A charging system malfunction may cause variances in system voltage and set voltage related DTCs. Refer to **Charging System Test** .

Circuit/System Verification

Engine running, verify the transmission control module (TCM) scan tool ignition 1 signal parameter is greater than 8.68 volts.

- If not greater than the specified range, refer to **Charging System Test** before performing Circuit/System Testing.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Ignition OFF, disconnect the X1 harness connector at the K71 TCM.
2. Test for less than 1.0 ohm between ground circuit terminal 23 or 1 and ground.
 - If greater than the specified value, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 21 and ground.
 - If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, replace the K71 TCM.
4. If all circuits test normal, replace the K71 TCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for TCM replacement, setup, and programming

DTC P2537: IGNITION ACCESSORY SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P2537

Ignition Accessory Switch Circuit Low Voltage

Circuit/System Description

The transmission control module (TCM) continuously monitors the ignition accessory voltage circuit. A low ignition accessory voltage reading at the TCM will cause DTC P2537 to set.

Conditions for Running the DTC

- DTC U0073 or U0140 is not set.
- Ignition ON.

Conditions for Setting the DTC

The TCM detects that ignition accessory voltage is less than 0.2 times battery voltage for 20 seconds.

Action Taken When the DTC Sets

DTC P2537 is a Type D DTC.

Conditions for Clearing the DTC

DTC P2537 is a Type D DTC.

Diagnostic Aids

A charging system malfunction may cause variances in system voltage and set voltage related DTCs. Refer to **Charging System Test** .

Engine running, verify the transmission control module (TCM) scan tool ignition 1 signal parameter is greater than 8.68 volts.

- If not greater than the specified range, refer to **Charging System Test** before performing Circuit/System Testing.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Ignition OFF, disconnect the X1 harness connector at the K71 TCM.
2. Test for less than 1.0 ohm between ground circuit terminal 23 or 1 and ground.
 - If greater than the specified value, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminates between the ignition accessory circuit terminal 24 and ground.
 - If the test lamp does not illuminate, test the ignition accessory circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition accessory circuit fuse is open, replace the K71 TCM.

4. If all circuits test normal, replace the K71 TCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for TCM replacement, setup, and programming

DTC P2761, P2763, OR P2764: TORQUE CONVERTER CLUTCH (TCC) PRESSURE CONTROL SOLENOID

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2761

Torque Converter Clutch (TCC) Pressure Control Solenoid Valve Control Circuit

DTC P2763

Torque Converter Clutch (TCC) Pressure Control Solenoid Valve Control Circuit High Voltage

DTC P2764

Torque Converter Clutch (TCC) Pressure Control Solenoid Valve Control Circuit Low Voltage

Circuit/System Description

The lock-up control solenoid (SLU) is installed on the valve body. It linearly controls lock-up clutch hydraulic pressure based on engine RPM, throttle opening degree signals, input speed sensor signals, and output speed sensor signals. This results in control of lock-up. As a fail-safe function, if any abnormality occurs in the lock-up control solenoid (SLU), then the TCM will shut off the current to the solenoid.

Conditions for Running the DTC

P2761

- The battery voltage is greater than 10.5 volts for 500 msec.
- The feedback current is less than 1358 mA.
- The transmission is not in limp home mode.
- DTCs P2762 and P2763 are not set.

P2763

The transmission is not in limp home mode.

P2764

The transmission is not in limp home mode.

Conditions for Setting the DTC

P2761

Deviation is between commanded current and feedback current.

P2763

The TCM detects at least 5 times more than 1358 mA current consumption of the SLU control circuit for 100 msec.

P2764

The TCM detects at least 5 times less than 20 mA current consumption of the SLU control circuit for 100 msec.

Action Taken When the DTC Sets

P2761

- DTC P2761 are Type A DTC.
- The TCM allows the vehicle to be operated only in the third gear.

P2763 and P2764

- DTCs P2763 and P2764 are Type B DTCs.
- No self learning function
- No lock-up control
- No lock-up slip control
- No neutral control
- No up slope mode

Conditions for Clearing the DTC

P2761

DTC P2761 is a Type A DTC.

P2763 and P2764

DTCs P2763 and P2764 are Type B DTCs.

BRAKE PEDAL POSITION SENSOR LEARN

Brake Pedal Position Sensor Learn is a procedure for the ECM to determine the position of the brake pedal position (BPP) sensor when the brake pedal is in the released position.

NOTE: **The Brake Pedal Position Sensor Learn procedure is required when the following service procedures have been performed:**

- An Engine Control Module Replacement
- A BPP Sensor Replacement
- Any repair procedure that effects the BPP Sensor alignment

1. Install a scan tool.
2. Monitor the ECM for DTCs with a scan tool. If other DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for the applicable DTC that set.
3. Navigate to the scan tool Brake Pedal Position Sensor Learn command by selecting the following:

1. Module Diagnosis
2. Engine Control Module
3. Configuration/Reset Functions
4. Learn Functions
5. Brake Pedal Position Sensor Learn
4. Ignition ON, Engine OFF, transmission in Park, brake pedal in the fully released position, select Learn.
5. Verify Brake Pedal Position Sensor and Brake Pedal Position Sensor Learned Home Position are within 1 Volts.
6. Select Exit.

TRANSMISSION FLUID LEVEL AND CONDITION CHECK

CAUTION: Use correct transmission fluid only. Failure to use the proper fluid may result in transmission internal damage.

1. The vehicle must be on a flat surface.
2. Move the selector lever into park (P) position.
3. Start the engine.
4. Wait until transmission temperature reaches 35°C (95°F).

NOTE: Do not raise the temperature by performing a stall test.

5. Move through the selector lever positions with the foot brake depressed. Switch the selector lever from position P to L and back to P. Hold each position for at least 2 seconds. Repeat this process twice.

Fig. 14: View Of Plug Gasket

Courtesy of GENERAL MOTORS COMPANY

6. Check the transmission fluid temperature with the diagnostic tool.
 1. If the transmission fluid temperature has reached about 35 -45°C (95-113°F), raise the vehicle.
 2. Remove the overflow plug (2). Remove and DISCARD the plug gasket (1).
 3. If the fluid is flowing as a steady stream, wait until the fluid begins to drip. If no fluid comes out, add the fluid until it drips out.
 4. If the fluid drips out (a drip per 1 second) from overflow hole, install the overflow plug (2) with a NEW gasket (1) and tighten to 24 (18 lb ft).
7. Lower the vehicle.

NOTE:

- In case of insufficient ATF, the oil pump will suck in air, causing the line pressure to decrease. This causes the clutch to slide, resulting in malfunctions such as a burned clutch.
- In case of excessive ATF, the gears in the transmission will agitate the ATF, causing bubbling and malfunctions such as deterioration. If the vehicle is driven under this condition, the ATF level increases and ATF may blow out of the breather.

8. Switch off the engine.

LINE PRESSURE CHECK

Special Tools

- **J-21867** Pressure Gauge
- **J-21867-50** Transmission Line Pressure Adapter

The line pressure test can inspect the working condition inside the automatic transmission (A/T) by measuring line pressure in drive (D)/reverse (R) range and idle/stall condition.

(1) D-Range

Fig. 15: Measuring Line Pressure In Drive (D - Range)
Courtesy of GENERAL MOTORS COMPANY

(2) R-Range

Fig. 16: Measuring Line Pressure In Drive (R - Range)
Courtesy of GENERAL MOTORS COMPANY

1. Wedge the 4 wheels and apply the parking brake fully. Lock the vehicle in place.
2. Install **J-21867** and **J-21867-50** to the test hole.

NOTE:

- **Make sure to take 3 measurements and use the average value.**
- **Do not continuously run longer than 5 seconds. Extreme increasing of oil temperature may occur.**

3. Start the engine.
4. Fully press on the brake pedal with the left foot, shift into drive (D) or reverse (R) range and measure the line pressure at idle/stall condition.

Specifications

- The engine idle line pressure in drive (D) is 0.62-0.77 mPa (90.65-112.40 psi).
 - The engine idle line pressure in reverse (R) is 0.49-0.53 mPa (72.37-78.18 psi).
 - The engine stall line pressure in drive (D) is 1.45-1.63 mPa (210.31-236.41 psi).
 - The engine stall line pressure in reverse (R) is 1.72-2.08 mPa (250.19-302.40 psi).
-

Test Results	Assumed Cause
Lower than standards in both drive (D) and reverse (R)	• Pressure control solenoid (SLC1 or SLC2) failure • Primary regulator valve failure • Oil pump failure • Leak from hydraulic circuit of drive (D) or reverse (R) range
Higher than standards only in drive (D)	• Pressure control solenoid (SLC1 or SLC2) failure • Primary regulator valve failure
Lower than standards only in drive (D)	• Hydraulic pressure circuit failure of drive (D) range • Forward clutch (C1) failure
Lower than standards only in reverse (R)	• Hydraulic pressure circuit of reverse (R) range • Reverse clutch (C3) failure • 1st and reverse brake (B3) failure

ROAD TEST

Purpose

The road test is to diagnose the failure symptom accurately and check the failure symptom after procedure.

Conditions

Make sure to perform the road test under the following conditions:

- The oil temperature before the road test is 50-80°C (122-176°F).
- Perform the road test after the engine inspection and adjustment.
- The air conditioning, lights etc. are turned off.

Procedure

Item	Procedure
Shift Function - Drive (D) Position	During the normal driving, check that the transmission shifts from 1st to 2nd gear, 2nd to 3rd gear, and then 3rd to 4th gear.
Amount of Shift Shock While Driving	During the normal driving, check for the smooth upshifting.
Kick-Down Function	• Check downshifting by performing kick-down for each gear. • Check the amount of shift shock during kick-down.
Operation of the Engine Brake	Check the operation of the engine brake in 1st gear when in manual mode.
Shifting Point When the Accelerator Pedal Is Fully Depressed	With the shift lever in the drive (D) position, fully depress the accelerator pedal to check if the point at which the transmission upshifts from 1st to 2nd gear matches the specified shift point.
	Check that it is possible to shift into every gear when the shift lever is

Manual Shift Control Function	in the manual mode position.
Lock-Up Control Function	Check that the engine speed does not change dramatically when slightly depressing the accelerator pedal while driving on a flat road at a speed that lock-up is in effect.
Park (P) Position Operation	Stop the vehicle on a slope (of about 5% or 3° or more), move the shift lever to the park (P) position, then release the parking brake and check that the vehicle does not move.
Oil Leak	After a road test, inspect each part and check that there are no oil leaks.

STALL SPEED TEST

Purpose

The purpose of the stall test is to inspect the overall performance of the automatic transmission (A/T) and the engine by measuring the stall speed in drive (D) and reverse (R) range.

Procedure

NOTE:

- Make sure to take 3 measurements and use the average value.
- Do not continuously run longer than 5 seconds. Extreme increasing of oil temperature may occur.
- In case of A/T with N control, when applying the accelerator pedal with braking (stall test), the forward clutch is engaged because N control is off.

Therefore, you must feel a slight driving force, however it isn't abnormal.

1. Wedge the 4 wheels and apply the parking brake fully. Lock the vehicle in place.
2. Start the engine.
3. Fully press on the brake pedal with the left foot.
4. Shift into drive (D) or reverse (R) range, fully press on the accelerator pedal with the right foot and quickly check the maximum engine rpm.

Specification

The standard stall speed is 2600 RPM.

Test Results	Assumed Cause
Lower than standards in both drive (D) and reverse (R)	• Less engine power • Torque converter one-way clutch slipping
Higher than standards only in drive (D)	• Low line pressure ◦ C1 Pressure control solenoid (SLC1) failure ◦ Primary regulator valve failure • Valve body failure

	○ C1 Pressure control solenoid (SLC1) hydraulic pressure system failure ● Forward clutch (C1) slipping ● One-way clutch (F2) failure
Higher than standards only in reverse (R)	● Low line pressure ○ C2 Pressure control solenoid (SLC2) failure ○ Primary regulator valve failure ● Valve body failure ○ C2 Pressure control solenoid (SLC2) hydraulic pressure system failure ● Reverse clutch (C3) slipping ● 1st and reverse brake (B3) slipping
Higher than standards in both drive (D) and reverse (R)	● Low line pressure ○ C1 Pressure control solenoid (SLC1) failure ○ C2 Pressure control solenoid (SLC2) failure ○ Primary regulator valve failure ● Oil pump failure ● Oil strainer clogging

ENGAGEMENT DELAY TEST

Purpose

Time lag is when a shock can be felt when shifting from neutral (N) to drive (D) and neutral (N) to reverse (R) while the engine is idling.

Procedure

- IMPORTANT:**
- **Make sure to take 3 measurements and use the average value.**
 - **When performing the test in succession, make sure to leave 1 minute intervals.**

1. Wedge the 4 wheels and apply the parking brake fully. Lock the vehicle in place.
2. Start the engine.
3. Depress the brake pedal and let the engine idle.
4. Using a stop watch, measure the time lag from the moment when the shift lever is shifted from neutral (N) to drive (D) and from neutral (N) to reverse (R), until slight shock can be felt.

Specifications

- The time lag from neutral (N) to drive (D) is less than 1.5 seconds.

- The time lag from neutral (N) to reverse (R) is less than 1.5 seconds.

Test Results	Assumed Cause
Longer than standards when shifting from neutral (N) to drive (D)	• Valve body failure ◦ C1 Pressure control solenoid (SLC1) hydraulic pressure system failure ◦ C2 Pressure control solenoid (SLC2) hydraulic pressure system failure • Forward clutch (C1) slipping • One-way clutch (F2) failure • Oil pump failure • Oil strainer clogging
Longer than standards when shifting from neutral (N) to reverse (R)	• Valve body failure ◦ C1 Pressure control solenoid (SLC1) hydraulic pressure system failure ◦ C2 Pressure control solenoid (SLC2) hydraulic pressure system failure ◦ Shift Solenoid (S1) hydraulic pressure system failure • Reverse clutch (C3) slipping • 1st and reverse brake (B3) slipping • Oil pump failure • Oil strainer clogging

CASE POROSITY REPAIR

WARNING: Refer to Eye Protection Warning .

1. Determine the leak area. Refer to Automatic Transmission Fluid Leaks.

WARNING: The epoxy adhesive may cause skin irritations and eye damage. Read and follow all of the information on the container label as provided by the manufacturer.

2. Clean the leak area with the solvent. Air dry.
3. Mix a sufficient amount of epoxy cement following the manufacturer's recommendations.
4. While the transaxle case is hot, apply epoxy cement with a clean, dry soldering acid brush.
5. Allow the epoxy cement to dry for 3 hours before starting the engine.

AUTOMATIC TRANSMISSION FLUID LEAKS

General Method

1. Verify that the material leaking is transaxle fluid.
2. Thoroughly clean the suspected leak area.
3. Allow the transaxle to reach the normal operating temperature of 176-194°F (80-90°C).
4. Park the vehicle over a clean paper or a clean cardboard.
5. Turn the engine OFF and look for fluid spots on the paper.
6. Make the necessary repairs to correct that leak.

Powder Method

1. Thoroughly clean the suspected leak area.
2. Apply an aerosol type powder, such as foot powder, to the suspected leak area.
3. Allow the transaxle to reach the normal operating temperature of 176-194°F (80-90°C).
4. Turn the engine OFF.
5. Inspect the suspected leak area and trace the leak path through the powder to find the source of the leak.
6. Make the necessary repairs to correct the leak. Once the leak point is found, the source of the leak must be determined and repaired.

TRANSMISSION ADAPTIVE LEARN

The purpose of the transmission adaptive learn procedure is to improve the shift quality.

Perform the transmission adaptive learn procedure after any of the following service procedures:

- Transmission Control Module (TCM) replacement
- TCM calibration change
- Control valve body replacement
- Transmission overhaul
- Transmission replacement

NOTE: **Do not make the stall test to raise up the transmission fluid temperature.**

1. Drive the vehicle to warm the transmission fluid until 50-80°C (122-176°F). The adaptive learn procedure will not work unless the transmission fluid is the correct temperature.
2. Perform the following steps for the garage shift learning.
 1. With the vehicle stationary, depress the brake and keep the shift lever in neutral (N) for 3 seconds.
 2. Move the shift lever from neutral (N) into drive (D) and maintain this condition for 3 seconds.
 3. Repeat the above step five times.
 4. Repeat the five times in the same way for reverse (R).
3. Perform the following steps for the gear shift control learning.
 1. Drive in drive (D) with the throttle opening between 25-35% until 4th gear and a vehicle speed of

80 km/h (50 mph) or higher is reached.

2. Release the accelerator pedal and coast and bring the vehicle to a stop within 60 seconds.
3. Repeat the above step ten times.
4. Check that the variable speed shock and shift shock have decreased compared to the conditions before learning.

INPUT SPEED SENSOR INSPECTION

Fig. 17: Input Speed Sensor Inspection 1
Courtesy of GENERAL MOTORS COMPANY

Inspection 1

NOTE: Do not damage the input speed sensor and terminals.

With a tester, test for the continuity between the terminals of the input speed sensor.

Specification

Continuity

NOTE: When measuring the resistance between the terminals, 100 kohms or more may be detected. However, this is not due to a malfunction.

Fig. 18: Input Speed Sensor Inspection 2
Courtesy of GENERAL MOTORS COMPANY

Inspection 2

1. Remove the input speed sensor.
2. Connect a positive lead from the battery to terminal 2 and a negative lead with a resistor of 100 ohms and ammeter to terminal 1.

NOTE: Do not damage the input speed sensor and terminals.

3. Measure the currenxy value when shaking metal hards (magnetic material) back and forth in front of the sensor (less than 5 mm).

Specifications

- The current of signal, HIGH is 12-16 mA.
- The current of signal, LOW is 4-8 mA.

OUTPUT SPEED SENSOR INSPECTION

Inspection 1

Fig. 19: Output Speed Sensor Inspection 1
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the output speed sensor and terminals.

With a tester, test for continuity between the terminals of the output speed sensor.

Specification

Continuity

NOTE: When measuring the resistance between the terminals, 100 kohms or more may be detected. However, this is not due to a malfunction.

Inspection 2

Fig. 20: Output Speed Sensor Inspection 2
Courtesy of GENERAL MOTORS COMPANY

1. Remove the output speed sensor.
2. Connect a positive lead from the battery to terminal 2 and a negative lead with a resistor of 100ohms and ammeter to terminal 1.

NOTE: Do not damage the output speed sensor and terminals.

3. Measure the currenxy value when shaking metal hards (magnetic material) back and forth in front of the sensor (less than 5 mm).

Specification

- The current of signal, HIGH is 12-16 mA.
- The current of signal, LOW is 4-8 mA.

PARK/NEUTRAL POSITION SWITCH INSPECTION

1. Disconnect the park/neutral position (PNP) switch connector.
2. Using a tester, check for continuity between the terminals from the switch.

3. Check that continuity is as specified in the table.

Park/Neutral Position Switch Inspection

Shift Position	Start (+) terminal 4 - Start (-) terminal 5	P terminal (6) - ground terminal (2)	R terminal (1) - ground terminal (2)	N terminal (9) - ground terminal (2)	D terminal (7) - ground terminal (2)	2 terminal (3) - ground terminal (2)	L terminal (8) - ground terminal (2)

PRESSURE CONTROL SOLENOID VALVE INSPECTION

Inspection 1

Fig. 21: Pressure Control Solenoid Valve Inspection 1
Courtesy of GENERAL MOTORS COMPANY

1. Remove the control valve body cover.
2. Remove the control valve body.

NOTE:

- Do not remove the pressure control solenoid from the valve body.
- Do not apply any impact to the solenoid.

3. With a tester, measure the resistance between terminal 1 and 2 of each solenoid.

Specification

The resistance at 20°C (68°F) is between 5.0-5.6 ohms.

Inspection 2

Fig. 22: Pressure Control Solenoid Valve Inspection 2
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Do not apply any impact to the solenoid.
- Do not damage the terminals.

Connect a positive lead with a bulb (12-21 w), from the battery to terminal 1 of each solenoid and connect a negative lead to terminal 2, and then check that the solenoid operates.

TRANSMISSION FLUID TEMPERATURE SENSOR INSPECTION

Inspection 1

Fig. 23: Transmission Fluid Temperature (TFT) sensor
Courtesy of GENERAL MOTORS COMPANY

1. Warm up ATF and insert the transmission fluid temperature (TFT) sensor in ATF.
2. Measure the resistance between terminals 1 and 7 of the TFT connector at 10°C (50°F) and 110°C (230°F).
3. If the resistance measurement of 10°C (50°F) is not between 5.626-7.303 kohms, replace the TFT sensor.
4. If the resistance measurement of 110°C (230°F) is not between 0.224-0.271 kohms, replace the TFT sensor.

Inspection 2

With a tester, check for continuity between each of the connector terminal combinations as the specification.

Specification

Continuity between the terminal 1 (OT) or 7 (OTG) and ground is no.

REPAIR INSTRUCTIONS - ON VEHICLE

AUTOMATIC TRANSMISSION RANGE SELECTOR LEVER REPLACEMENT

Fig. 24: Automatic Transmission Range Selector Lever Fastener
 Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Range Selector Lever Replacement

Callout	Component Name
Preliminary Procedures 1. Ensure that the shift control range select lever is in the park (P) position. 2. Remove the front bumper fascia opening lower cover. Refer to Front Bumper Fascia Opening Lower Cover Replacement . 3. Disconnect the shift control cable from the transmission range selector lever. 4. Depress the shift control cable retainer clip tabs and remove the shift control cable from the shift control cable bracket.	
1	Automatic Transmission Range Selector Lever Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 12 (106 lb in)
2	Automatic Transmission Range Selector Lever Washer
3	Automatic Transmission Range Selector Lever

RANGE SELECTOR LEVER CABLE REPLACEMENT

Removal Procedure

1. Set the park brake and chock the wheels.
2. Remove the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#).

Fig. 25: Transmission Range Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

3. Position the transmission manual shift lever into the park position.
4. Disconnect the transmission range selector lever cable terminal (1) from the transmission range selector lever.
5. Press the retainer clip tabs inward in order to release the transmission range selector lever cable (2) from the cable bracket.

Fig. 26: Cable Clamp And Cable
Courtesy of GENERAL MOTORS COMPANY

6. Disconnect the cable (1) from the cable clamp (2).
7. Remove the console. Refer to **Front Floor Console Replacement** .

Fig. 27: Transmission Range Selector Lever Cable Terminal And Shift Lever Pin
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the transmission range selector lever cable terminal (2) from the shift lever pin (3).
9. Release the transmission range selector lever cable retainer (1) and remove the transmission range selector cable from the transmission control lever base (4).

Fig. 28: Transmission Range Selector Lever Cable Grommet Nuts
Courtesy of GENERAL MOTORS COMPANY

10. Remove the transmission range selector lever cable grommet nuts (1).
11. Remove the transmission range selector lever cable grommet (2).
12. Remove the transmission range selector lever cable from the vehicle.

Installation Procedure

Fig. 29: Transmission Range Selector Lever Cable Grommet Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Verify that the transmission manual shift lever is in the park position.
2. Install the transmission range selector lever cable to the vehicle.
3. Install the transmission range selector lever cable grommet (2).

CAUTION: Refer to Fastener Caution .

4. Install the transmission range selector lever cable grommet nuts (1) and tighten to 6 (53 lb in).

Fig. 30: Transmission Range Selector Lever Cable Terminal And Shift Lever Pin
Courtesy of GENERAL MOTORS COMPANY

5. Install the transmission range selector lever cable to the transmission control lever base. Insure the cable retainer (1) is fully secured to the transmission control lever base (4).
6. Connect the transmission range selector lever cable terminal (2) to the shift lever pin (3).
7. Install the console. Refer to **Front Floor Console Replacement** .

Fig. 31: Cable Clamp And Cable

Courtesy of GENERAL MOTORS COMPANY

8. Connect the cable (1) from the cable clamp (2).

Fig. 32: Transmission Range Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

9. Install the transmission range selector lever cable (2) to the cable bracket.
10. Connect the transmission range selector lever cable terminal (1) to the transmission range selector lever.
11. Adjust the automatic transmission range selector lever cable. Refer to **Range Selector Lever Cable Adjustment**.
12. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.

RANGE SELECTOR LEVER CABLE ADJUSTMENT

NOTE: Adjust the automatic transmission range selector cable while the transmission and the gear selector are in the Park position only. Failure to do so may cause miss-adjustment.

1. Set the park brake and chock the wheels.
2. Remove the front bumper fascia opening lower cover. Refer to **Front Bumper Fascia Opening Lower Cover Replacement**.
3. Verify the transmission range select lever is in the park (P) position.
4. Verify the transmission manual shift lever is in the P position.

Fig. 33: Transmission Range Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the transmission range selector lever cable terminal (1) from the transmission range selector lever.
6. Press the retainer clip tabs inward in order to release the transmission range selector lever cable (2) from the cable bracket.

Fig. 34: Cable Adjuster And Cable Adjuster Guide
Courtesy of GENERAL MOTORS COMPANY

7. Pull up on the cable adjuster (1) from the cable adjuster guide (2).

Fig. 35: Transmission Range Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

8. Install the transmission range selector lever cable (1) to the cable bracket.
9. Connect the range selector lever cable adjuster (2) to the transmission range selector lever pin.

Fig. 36: Cable Adjuster Guide

Courtesy of GENERAL MOTORS COMPANY

10. Pull up on the cable adjuster guide (1) to secure in place.
11. Install the front bumper fascia opening lower cover. Refer to **Front Bumper Fascia Opening Lower Cover Replacement** .
12. Check the transmission range select lever in all gear selections for proper operation.

RANGE SELECTOR LEVER CABLE BRACKET REPLACEMENT

Removal Procedure

1. Set the park brake and chock the wheels.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

Fig. 37: Transmission Range Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the transmission range selector lever cable terminal (1) from the range selector lever.
4. Disconnect the range selector lever cable (2) from the range selector lever cable bracket.

Fig. 38: Transmission Range Selector Cable Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the transmission range selector cable bracket bolts (1).
6. Remove the transmission range selector cable bracket (2).

Installation Procedure

Fig. 39: Transmission Range Selector Cable Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission range selector cable bracket (2).

CAUTION: Refer to Fastener Caution .

2. Install the transmission range selector lever cable bracket bolts (1) and tighten to 22 (16 lb ft).

Fig. 40: Transmission Range Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

3. Connect the range selector lever cable (2) to the range selector lever cable bracket.
4. Connect the transmission range selector lever cable terminal (1) to the range selector lever.
5. Check the range selector lever cable adjustment. Refer to **Range Selector Lever Cable Adjustment**.
6. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

TRANSMISSION CONTROL LEVER KNOB REPLACEMENT

Fig. 41: Transmission Control Lever Knob
 Courtesy of GENERAL MOTORS COMPANY

Transmission Control Lever Knob Replacement

Callout	Component Name
1	Transmission Control Lever Knob Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 (27 lb in)
2	Transmission Control Lever Knob Procedure Remove the transmission control lever knob from the transmission control.

TRANSMISSION CONTROL REPLACEMENT

Fig. 42: Transmission Control
 Courtesy of GENERAL MOTORS COMPANY

Transmission Control Replacement

Callout	Component Name
Preliminary Procedure Remove floor console. Refer to Front Floor Console Replacement .	
1	Transmission Control Fastener (Qty: 4) CAUTION: Refer to Fastener Caution . Procedure 1. Remove the clips on the wiring harness and disconnect the shift control electrical connector. 2. Disconnect the shift control cable. Tighten 9 (80 lb in)
2	Transmission Control

PARK/NEUTRAL POSITION SWITCH REPLACEMENT

Special Tool

DT-45404 Transmission Indicator Alignment Tool

Removal Procedure

Fig. 43: Negative Battery Cable

Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
2. Remove the front bumper fascia opening lower cover. Refer to **Front Bumper Fascia Opening Lower Cover Replacement** .
3. Disconnect the park/neutral position (PNP) switch electrical connector (1).
4. Disconnect the transmission range selector lever cable terminal (2) from the transmission range selector lever.

Fig. 44: Spring Washer And Control Shaft Lever
Courtesy of GENERAL MOTORS COMPANY

5. Remove the nut (1), spring washer and control shaft lever (2).
6. Remove the 2 bolts (3).
7. Remove and DISCARD the PNP switch.

Installation Procedure

Fig. 45: Park/Neutral Position (PNP) Switch
Courtesy of GENERAL MOTORS COMPANY

NOTE: The park/neutral position (PNP) switch is inserted into the manual valve lever shaft by press fitting. Do NOT reuse the PNP switch once the switch is removed from the shaft. The used PNP switch may cause detection failure of position since the holding part of the used switch is deformed.

1. Install a NEW park/neutral position (PNP) switch onto the manual valve lever shaft and temporarily install the 2 bolts (1).

Fig. 46: View Of Range Selector Lever
Courtesy of GENERAL MOTORS COMPANY

2. Install the range selector lever temporarily and move to N (neutral) position.
3. Remove the range selector lever.

Fig. 47: Selector Lever Shaft With Neutral Basic Line
Courtesy of GENERAL MOTORS COMPANY

4. Install **DT-45404** transmission indicator alignment tool to the manual shaft
5. Align the groove on the switch with the indicator line on DT-45404.

Fig. 48: Spring Washer And Control Shaft Lever
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

6. Install the 2 PNP switch bolts (3) and tighten to 5 (44 lb in).
7. Remove DT-45404 from the manual shaft.
8. Install the range selector lever (2), washer and nut (1) and tighten to 12 (106 lb in).

Fig. 49: Negative Battery Cable

Courtesy of GENERAL MOTORS COMPANY

9. Connect the transmission range selector lever cable terminal (2) to the transmission range selector lever.
10. Connect the park/neutral position (PNP) switch electrical connector (1).
11. Adjust the selector lever cable. Refer to **Range Selector Lever Cable Adjustment**.
12. Install the front bumper fascia opening lower cover. Refer to **Front Bumper Fascia Opening Lower Cover Replacement**.
13. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection**.
14. Verify that the engine starts in neutral (N) position.

AUTOMATIC TRANSMISSION FLUID AND FILTER REPLACEMENT

Fig. 50: Automatic Transmission Fluid And Filter
 Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Fluid and Filter Replacement

Callout	Component Name
Preliminary Procedure	
Remove the control valve body cover. Refer to <u>Control Valve Body Cover Replacement</u> .	
1	Oil Strainer
2	O-Ring TIP: Do not reuse the O-ring.

TRANSMISSION FLUID DRAIN AND FILL

Fig. 51: Transmission Fluid Drain And Fill
Courtesy of GENERAL MOTORS COMPANY

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the drain plug (1) and drain transmission fluid into a suitable container while the engine is stopped.
3. Remove the gasket (2) from the drain plug.
4. Install the NEW gasket (2) to the drain plug.

CAUTION: Refer to Fastener Caution .

5. Install the drain plug (1) and tighten to 17 (13 lb ft).
6. Lower the vehicle.

Fig. 52: Fill Plug And Seal

Courtesy of GENERAL MOTORS COMPANY

7. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
8. Remove the range selector lever cable bracket. Refer to **Range Selector Lever Cable Bracket Replacement**.
9. Remove the fill plug (1) and seal (2).
10. Fill the transmission to the proper level with the correct fluid. Refer to **Transmission General Specifications**.
11. Install the fill plug (1) with NEW seal (2) and tighten to 30 (22 lb ft).
12. Install the range selector lever cable bracket. Refer to **Range Selector Lever Cable Bracket Replacement**.
13. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
14. Check the ATF level. Refer to **Transmission Fluid Level and Condition Check**.

TRANSMISSION FLUID COOLER PIPE CONNECTOR REPLACEMENT - RADIATOR

Removal Procedure

1. Drain the cooling system. Refer to **Cooling System Draining and Filling** .
2. Remove the transaxle oil cooler hoses from the oil cooler fittings on the radiator. Refer to **Transmission**

Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection.

Fig. 53: View Of Oil Cooler Fitting At Radiator
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not remove the upper and lower transaxle oil cooler fittings from the radiator at the same time other wise the transaxle oil cooler will fall inside the radiator end tank.

3. Remove the oil cooler fitting from the radiator.

Installation Procedure

1. Inspect the new O-ring seals for cracks, cuts or damage. Replace if necessary.

Fig. 54: View Of Oil Cooler Fitting At Radiator
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: The correct thread engagement is critical. Cross-threaded fittings can achieve proper tightness and still leak.

2. Install the oil cooler fitting to the radiator and tighten to 20 (15 lb ft).
3. Install the transaxle oil cooler hoses to the oil cooler fittings on the radiator. Refer to Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection.
4. Fill the cooling system. Refer to Cooling System Draining and Filling .
5. Adjust the transmission fluid level.
6. Inspect for fluid leaks.

TRANSMISSION FLUID COOLER HOSE/PIPE QUICK-CONNECT FITTING DISCONNECTION AND CONNECTION

Removal Procedure

Fig. 55: Automatic Transmission Oil Cooler Fitting Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

NOTE: Perform the following procedure when removing the retaining rings and cooler lines from the quick connect fittings located on the radiator and/or the transmission.

1. Pull the plastic cap back from the quick connect fitting and down along the cooler line about 5 cm (2 in).
2. Using a bent-tip screwdriver, pull on one of the open ends of the retaining ring (1) in order to rotate the retaining ring around the quick connect fitting until the retaining ring is out of position and can be completely removed.
3. Remove the retaining ring from the quick connect fitting.
4. Discard the retaining ring.

Fig. 56: Automatic Transmission Cooler Line
Courtesy of GENERAL MOTORS COMPANY

5. Pull the cooler line (1) straight out from the quick connect fitting (2).

Installation Procedure

NOTE:

- Do not reuse any of the existing oil lines or oil line fittings if there is excessive corrosion.
- Do not reuse any of the existing retaining rings that were removed from the existing quick connect fittings. Install new retaining rings.
- Ensure the following procedures are performed when installing the new retaining rings onto the fittings.

1. Install a new retaining ring into the quick connect fitting using the following procedure:

Fig. 57: Automatic Transmission Oil Cooler Fitting Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

2. Hook one of the open ends of the retaining ring (1) in one of the slots in the quick connect fitting.

Fig. 58: Rotating Automatic Transmission Oil Cooler Fitting Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

3. Rotate the retaining ring (1) around the fitting until the retaining ring is positioned with all three ears through the three slots on the fitting.

Fig. 59: Automatic Transmission Oil Cooler Fitting Retaining Ring Caution
Courtesy of GENERAL MOTORS COMPANY

4. Do not install the new retaining ring (1) onto the fitting by pushing the retaining ring.

Fig. 60: Retaining Ring Ears

Courtesy of GENERAL MOTORS COMPANY

5. Ensure that the three retaining ring ears are seen from inside the fitting (1) and that the retaining ring moves freely in the fitting slots.

Fig. 61: Cutaway View Of Automatic Transmission Oil Cooler Fitting
Courtesy of GENERAL MOTORS COMPANY

6. Install the cooler line (1) into the quick connect fitting (2).
7. Insert the cooler line end into the quick connect fitting until a click is either heard or felt.

Fig. 62: Automatic Transmission Oil Cooler Line And Fitting Caution
Courtesy of GENERAL MOTORS COMPANY

8. Do not use the plastic cap (1) on the cooler line in order to install the cooler line into the fitting.
9. Pull back sharply on the cooler line in order to ensure that the cooler line is fastened into the quick connect fitting.

Fig. 63: Automatic Transmission Oil Cooler Fitting Plastic Cap
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not manually depress the retaining clip when installing the plastic cap.

10. Position (snap) the plastic cap (1) onto the fitting. Do not manually depress the retaining ring when installing the plastic cap onto the quick connect fitting.
11. Ensure that the plastic cap is fully seated against the fitting.

Fig. 64: Automatic Transmission Oil Cooler Fitting Plastic Cap Caution
Courtesy of GENERAL MOTORS COMPANY

12. Ensure that no gap is present between the plastic cap (1) and the fitting (2).

Fig. 65: Yellow Identification Band
Courtesy of GENERAL MOTORS COMPANY

13. Ensure that the yellow identification band (1) on the tube is hidden within the quick connect fitting.

Fig. 66: Yellow Identification Band Caution
Courtesy of GENERAL MOTORS COMPANY

14. A hidden yellow identification band (1) indicates proper joint seating.
15. Fill the transmission to the proper level. Refer to **Transmission Fluid Level and Condition Check.**

AUTOMATIC TRANSMISSION FLUID PRESSURE TEST HOLE PLUG REPLACEMENT

Fig. 67: Automatic Transmission Fluid Pressure Test Hole Plug
 Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Fluid Pressure Test Hole Plug Replacement

Callout	Component Name
1	Fluid Pressure Test Plug CAUTION: Refer to <u>Fastener Caution</u> . Tighten 7 (62 lb in)
2	O-Ring TIP: Do not reuse the O-ring.

INPUT SPEED SENSOR REPLACEMENT

Fig. 68: Input Speed Sensor
 Courtesy of GENERAL MOTORS COMPANY

Input Speed Sensor Replacement

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> 2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> .	
1	Input Speed Sensor Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the input speed sensor electrical connector. Tighten 5 (44 lb in)
2	Input Speed Sensor

OUTPUT SPEED SENSOR REPLACEMENT

Fig. 69: Output Speed Sensor
 Courtesy of GENERAL MOTORS COMPANY

Output Speed Sensor Replacement

Callout	Component Name
Preliminary Procedure 1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> .	
1	Output Speed Sensor Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the output speed sensor electrical connector. Tighten 5 (44 lb in)
2	Output Speed Sensor

1-2 SHIFT SOLENOID VALVE REPLACEMENT

Fig. 70: 1-2 Shift Solenoid Valve
 Courtesy of GENERAL MOTORS COMPANY

1-2 Shift Solenoid Valve Replacement

Callout	Component Name
Preliminary Procedure Remove the oil Strainer. Refer to <u>Automatic Transmission Fluid and Filter Replacement</u> .	
1	Shift Solenoid Valve Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the electrical connector. Tighten 7 (62 lb in)
2	Shift Solenoid Valve

TRANSMISSION CONTROL MODULE REPLACEMENT

Fig. 71: Transmission Control Module
 Courtesy of GENERAL MOTORS COMPANY

Transmission Control Module Replacement

Callout	Component Name
1	TCM Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 7 (62 lb in)
2	Transmission Control Module (TCM) Procedure 1. Disconnect the TCM electrical connector. 2. The TCM must be programmed when replaced. Refer to <u>Control Module References</u> for programming and setup information. 3. Perform the transmission adaptive learn when replaced. Refer to <u>Transmission Adaptive Learn</u>.
3	TCM Cover

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - LEFT SIDE

Fig. 72: Front Wheel Drive Shaft Seal - Left Side
 Courtesy of GENERAL MOTORS COMPANY

Front Wheel Drive Shaft Seal Replacement - Left Side

Callout	Component Name
Preliminary Procedures	
1. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the left wheel drive shaft. Refer to <u>Front Wheel Drive Shaft Replacement</u> .	
	Left Front Wheel Drive Shaft Oil Seal
	Procedure - For seal removal, use DT-7004 slide hammer with DT-586 seal remover. - For seal installation, use DT-47521 seal installer.
1	Special Tools • DT-586 Seal Remover • DT-7004 Slide Hammer • DT-47521 Seal Installer
For equivalent regional tools, refer to <u>Special Tools</u> .	

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - RIGHT SIDE

Fig. 73: Front Wheel Drive Shaft Seal - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Front Wheel Drive Shaft Seal Replacement - Right Side

Callout	Component Name
Preliminary Procedures	
1. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the right wheel drive shaft. Refer to <u>Front Wheel Drive Shaft Replacement</u> .	
	Right Front Wheel Drive Shaft Oil Seal
	Procedure 1. For seal removal, use DT-7004 slide hammer with DT-586 seal remover. 2. For seal installation, use DT-46471 seal installer.
1	Special Tools • DT-586 Seal Remover • DT-7004 Slide Hammer • DT-46471 Seal Installer
For equivalent regional tools, refer to <u>Special Tools</u> .	

CONTROL VALVE BODY COVER REPLACEMENT

Fig. 74: Control Valve Body Cover
 Courtesy of GENERAL MOTORS COMPANY

Control Valve Body Cover Replacement

Callout	Component Name
Preliminary Procedure Drain the transmission. Refer to <u>Transmission Fluid Drain and Fill</u> .	
1	Control Valve Body Cover Bolt (Qty: 17) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 7 N.m (62 lb in)
2	Magnet (Qty: 4)
3	Gasket TIP: Do not reuse the gasket.
4	Control Valve Body Cover

CONTROL VALVE BODY REPLACEMENT

Removal Procedure

1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .

2. Remove the control valve body cover. Refer to **Control Valve Body Cover Replacement**.
3. Remove the oil strainer. Refer to **Automatic Transmission Fluid and Filter Replacement**.

Fig. 75: Transmission Fluid Temperature Sensor Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Remove the bolt (1) and transmission fluid temperature sensor clamp (2), and pull out the sensor (3) from the valve body assembly.
5. Disconnect the 5 solenoid connectors (4).

Fig. 76: Valve Body Assembly

Courtesy of GENERAL MOTORS COMPANY

6. Support the valve body assembly and remove the 11 bolts (1, 2).
7. Disconnect the manual valve control rod from the manual valve lever, then remove the valve body assembly.

Installation Procedure

Fig. 77: Manual Valve Control Rod And Manual Lever
Courtesy of GENERAL MOTORS COMPANY

1. Connect the manual valve control rod (2) to the manual lever (1).

Fig. 78: Valve Body Assembly

Courtesy of GENERAL MOTORS COMPANY

NOTE: When installing the valve body to the transmission case, do not let the accumulator piston incline. When installing the valve body to the transmission case, do not hold the solenoid.

2. Install the valve body assembly to the transmission case.

CAUTION: Refer to Fastener Caution .

NOTE: The bolts (1) size is 20 mm and the bolts (2) size is 36 mm.

3. Install the 11 valve body bolts (1, 2) and tighten to 11 (97 lb in).

Fig. 79: Transmission Fluid Temperature Sensor Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Connect the 5 connectors (4).
5. Install the transmission fluid temperature sensor (3) with the clamp (2).
6. Install the transmission fluid temperature sensor bolt (1) and tighten to 7 (62 lb in).
7. Install the oil strainer. Refer to **Automatic Transmission Fluid and Filter Replacement**.
8. Install the control valve body cover. Refer to **Control Valve Body Cover Replacement**.
9. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .
10. Perform the transmission adaptive learn when replaced. Refer to **Transmission Adaptive Learn**.

AUTOMATIC TRANSMISSION WIRING HARNESS REPLACEMENT

Removal Procedure

1. Remove the control valve body. Refer to **Control Valve Body Replacement**.

Fig. 80: Wiring Harness Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the wiring harness and do not pull out the harness forcibly.

2. Remove the bolt (1) and transmission wiring harness from the transmission case.
3. Remove the wiring harness assembly (2) from the transmission case.

Installation Procedure

Fig. 81: Wiring Harness Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the wiring harness assembly (2) to the transmission.

CAUTION: Refer to Fastener Caution .

2. Install the transmission wiring harness bolt (1) and tighten to 5 (44 lb in).
3. Install the control valve body. Refer to **Control Valve Body Replacement**.

TRANSMISSION REAR MOUNT BRACKET REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Using a suitable jack stand, support the rear of the powertrain.

Fig. 82: Transmission Bracket Mount

Courtesy of GENERAL MOTORS COMPANY

3. Remove the transmission bracket mount to mount through bolt and nut (1).

Fig. 83: Transmission Mount To Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the transmission mount to transmission bolts (1).
5. Remove the transmission mount bracket (2).

Installation Procedure

Fig. 84: Transmission Mount To Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission mount bracket (2).

CAUTION: Refer to Fastener Caution .

2. Install the transmission mount to transmission bolts (1) and tighten to 60 (44 lb ft).

Fig. 85: Transmission Bracket Mount
Courtesy of GENERAL MOTORS COMPANY

3. Install the transmission bracket mount to mount through bolt and nut (1) and tighten to 80 (59 lb ft).
4. Remove the jack stand.
5. Lower the vehicle.

TRANSMISSION REAR MOUNT REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Using a suitable jack stand, support the rear of the powertrain.

Fig. 86: Transmission Bracket Mount
Courtesy of GENERAL MOTORS COMPANY

3. Remove the transmission bracket mount to mount through bolt and nut (1).

Fig. 87: Transmission Mount To Frame Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Remove the transmission mount to frame bolt (1).
5. Remove the transmission mount (2).

Installation Procedure

Fig. 88: Transmission Mount To Frame Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission mount (2).

CAUTION: Refer to Fastener Caution .

2. Install the transmission mount to frame bolt (1) and tighten to 100 (74 lb ft).

Fig. 89: Transmission Bracket Mount
Courtesy of GENERAL MOTORS COMPANY

3. Install the transmission bracket mount to mount through bolt and nut (1) and tighten to 80 (59 lb ft).
4. Remove the jack stand.
5. Lower the vehicle.

TRANSMISSION MOUNT BRACKET REPLACEMENT - LEFT SIDE

Special Tools

EN-28467 Engine Fixture

For equivalent regional tools, refer to **Special Tools**.

Removal Procedures

1. Remove the battery tray. Refer to **Battery Tray Replacement** .
2. Remove the power brake booster pump bracket. Refer to **Power Brake Booster Pump Replacement (Automatic Transmission)** , **Power Brake Booster Pump Replacement (CVT)** .
3. Install the **EN-28467** engine fixture. Refer to **Engine Support Fixture** .
4. Remove the left transmission mount. Refer to **Transmission Mount Replacement - Left Side (MX2,**

MEM) .

Fig. 90: Left Transmission Mount Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the left transmission mount bracket bolts (1).
6. Remove the left transmission mount bracket (2) from the vehicle.

Installation Procedure

Fig. 91: Left Transmission Mount Bracket Bolts
 Courtesy of GENERAL MOTORS COMPANY

1. Install the left transmission mount bracket (2) to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the left transmission mount bracket bolts (1) and tighten to 60 (44 lb ft).
3. Install the left transmission mount. Refer to Transmission Mount Replacement - Left Side (MX2, MFM) .
4. Remove the EN-28476 engine fixture. Refer to Engine Support Fixture .
5. Install the power brake booster pump bracket. Refer to Power Brake Booster Pump Replacement (Automatic Transmission) , Power Brake Booster Pump Replacement (CVT) .
6. Install the battery tray. Refer to Battery Tray Replacement .

TRANSMISSION MOUNT REPLACEMENT - LEFT SIDE

Special Tools

EN-28467 Engine Fixture

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Remove the battery tray. Refer to **Battery Tray Replacement** .
2. Install the EN-28467 engine fixture. Refer to **Engine Support Fixture** .

Fig. 92: Left Transmission Mount Bolt And Nut
Courtesy of GENERAL MOTORS COMPANY

3. Remove the left transmission mount bolt and nut (1) from the transmission mount bracket (2).

Fig. 93: Left Transmission Mount

Courtesy of GENERAL MOTORS COMPANY

4. Remove the left transmission mount to body bolts (1).
5. Remove the left transmission mount (2) from the vehicle.

Installation Procedure

Fig. 94: Left Transmission Mount

Courtesy of GENERAL MOTORS COMPANY

1. Install the left transmission mount (2) to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the left transmission mount to body bolts (1) and tighten to 50 (37 lb ft).

Fig. 95: Left Transmission Mount Bolt And Nut
Courtesy of GENERAL MOTORS COMPANY

3. Install the left transmission mount bolt and nut (1) to the transmission mount bracket (2) and tighten to 95 (70 lb ft).
4. Remove the **EN-28467** engine fixture. Refer to **Engine Support Fixture** .
5. Install the battery tray. Refer to **Battery Tray Replacement** .

TRANSMISSION REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Drain the transmission fluid. Refer to **Transmission Fluid Drain and Fill**.
3. After removing the related parts for the powertrain assembly removal, remove the powertrain assembly from the vehicle. Refer to **Engine Replacement (LFM)** , **Engine Replacement (LL0)** .
4. Remove the starter. Refer to **Starter Replacement** .

Fig. 96: Torque Converter Bolts

Courtesy of GENERAL MOTORS COMPANY

5. Remove and discard the torque converter bolts (1).
6. Disconnect the transmission wiring harness electrical connector.
7. Disconnect the input speed sensor electrical connector.
8. Disconnect the output speed sensor electrical connector.
9. Disconnect the park/neutral position (PNP) switch electrical connector.
10. Remove the oxygen sensor connector bracket bolt and bracket.
11. Remove the crankshaft position sensor. Refer to **Crankshaft Position Sensor Replacement** .

Fig. 97: Radiator Inlet And Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

12. Remove the radiator inlet and outlet hose clamp (1).
13. Disconnect the radiator inlet and outlet hoses (2, 3) and remove the radiator and condenser assembly (4).
14. Disconnect the oil cooler pipes from the transmission. Refer to **Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Aisin 80-40LE)** , **Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Jatco CVT)** .

Fig. 98: Selector Control Cable Clamp Bolt And Clamp
Courtesy of GENERAL MOTORS COMPANY

15. Remove the selector control cable clamp bolt (1) and clamp (2).
16. Separate the related wiring harness from the transmission.
17. Remove the front wheel drive shaft from the transmission. Refer to **Front Wheel Drive Shaft Replacement** .
18. Remove the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement**.
19. Remove the left transmission mount bracket. Refer to **Transmission Mount Replacement - Left Side**.

Fig. 99: Torque Converter Cover Plate Bolts
Courtesy of GENERAL MOTORS COMPANY

20. Remove the torque converter cover plate bolts (1).
21. Remove the torque converter cover plate (2).

Fig. 100: Transmission Upper Bolts
Courtesy of GENERAL MOTORS COMPANY

22. Remove the transmission upper bolts (1).
23. Remove the transmission lower bolt (2).
24. Remove the transmission lower nut (3).
25. Separate the transmission from the engine.

Installation Procedure

Fig. 101: Transmission Upper Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission to the engine.

CAUTION: Refer to Fastener Caution .

2. Install the transmission lower nut (3) and tighten to 61 (44 lb ft).
3. Install the transmission lower bolt (2) and tighten to 61 (44 lb ft).
4. Install the transmission upper bolts (1) and tighten to 61 (44 lb ft).

Fig. 102: Torque Converter Cover Plate Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install the torque converter cover plate (2).
6. Install the torque converter cover plate bolts (1) and tighten to 10 (89 lb in).
7. Install the left transmission mount bracket. Refer to **Transmission Mount Replacement - Left Side**.
8. Install the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement (MX2, MFM)**.
9. Install the front wheel drive shaft to the transmission. Refer to **Front Wheel Drive Shaft Replacement**.
10. Position the wiring harness into the transmission.

Fig. 103: Selector Control Cable Clamp Bolt And Clamp
Courtesy of GENERAL MOTORS COMPANY

11. Install clamp (2) and the selector control cable clamp bolt (1) tighten to 22 (16 lb ft).

Fig. 104: Radiator Inlet And Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

12. Connect the oil cooler pipes to the transmission. Refer to **Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Aisin 80-40LE)** , **Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Jatco CVT)** .
13. Install the radiator and condenser assembly (4) and connect the radiator inlet and outlet hoses (2, 3).
14. Install the radiator inlet and outlet hose clamp (1).
15. Install the crankshaft position sensor. Refer to **Crankshaft Position Sensor Replacement** .
16. Install the oxygen sensor connector bracket with a bolt and tighten to 10 (89 lb in).
17. Connect the park/neutral position (PNP) switch electrical connector.
18. Connect the output speed sensor electrical connector.
19. Connect the input speed sensor electrical connector.
20. Connect the transmission wiring harness electrical connector.

Fig. 105: Torque Converter Bolts
Courtesy of GENERAL MOTORS COMPANY

21. Install NEW torque converter bolts (1) and tighten to 60 (44 lb ft).
22. Install the starter. Refer to **Starter Replacement** .
23. Install the powertrain assembly to the vehicle and then install the related parts. Refer to **Engine Replacement (LFM)** , **Engine Replacement (LL0)** .
24. Perform the transmission fluid cooler flushing and flow test. Refer to **Transmission Fluid Cooler Flushing and Flow Test (JATCO CVT)** , **Transmission Fluid Cooler Flushing and Flow Test (Aisin 80-40LE)** .
25. Fill the transmission with fluid. Refer to **Transmission Fluid Drain and Fill**.
26. Check the transmission fluid for proper level. Refer to **Transmission Fluid Level and Condition Check**.
27. Perform the transmission adaptive learn when replaced. Refer to **Transmission Adaptive Learn**.

REPAIR INSTRUCTIONS - OFF VEHICLE

TRANSMISSION DISASSEMBLE

Special Tools

- DT-46455 (DW240-060-01) Brake Spring Compressor Bolt/Nut

- **DT-46457 (DW240-070)** 1st and Reverse Brake Adapter
- **DT-46459 (DW240-090)** Planetary Ring Gear Remover
- **DT-46463 (DW240-150)** Transmission Case Side Bearing Outer Race Adapter
- **DT-46465 (DW240-170)** Adapter Handle
- **DT-46472 (DW240-041)** Planetary Ring Gear Nut Removal/Installation Socket

For equivalent regional tools, refer to **Special Tools**.

Disassembly Procedure

Fig. 106: Spring Washer And Control Shaft Lever
Courtesy of GENERAL MOTORS COMPANY

1. Remove the torque converter from the transmission.
2. Remove the nut (1), spring washer and control shaft lever (2).
3. Remove the 2 bolts (3) and pull out and DISCARD the park/neutral position (PNP) switch.

Fig. 107: Breather Plug Bracket

Courtesy of GENERAL MOTORS COMPANY

4. Remove the bolt (1) and breather plug bracket (2) from the transmission case.
5. Disengage the hose clamp and remove the breather hose (3).
6. Remove the breather plug from the transmission case.
7. Remove the O-ring from the breather plug.

Fig. 108: Input Speed Sensor

Courtesy of GENERAL MOTORS COMPANY

8. Remove the bolt (1) and input speed sensor (2).
9. Remove the bolt (3) and output speed sensor (4).

Fig. 109: Transmission Hook Nut
Courtesy of GENERAL MOTORS COMPANY

10. Remove the transmission hook nut (1) and hook (2).

Fig. 110: Transmission Oil Pan Side Facing Up
Courtesy of GENERAL MOTORS COMPANY

11. Place the wooden blocks to fix the transmission oil pan side facing up.

Fig. 111: Oil Pan And Oil Pan Gasket
Courtesy of GENERAL MOTORS COMPANY

12. Remove the 17 oil pan bolts (1).
13. Remove the oil pan (2) and oil pan gasket.
14. Remove the drain plug gasket and drain plug (3) from the oil pan.

Fig. 112: Oil Pan

Courtesy of GENERAL MOTORS COMPANY

15. 15.Remove the magnets and use them to collect any steel chips.
16. Examine the chips and particles in the pan and on the magnet to determine what type of wear has occurred in the transmission.

Fig. 113: Oil Strainer

Courtesy of GENERAL MOTORS COMPANY

17. Pull the oil strainer (1) and remove it.

Fig. 114: Oil Strainer

Courtesy of GENERAL MOTORS COMPANY

18. Remove O-ring (1) from the oil strainer.

Fig. 115: Transmission Fluid Temperature Sensor Clamp
Courtesy of GENERAL MOTORS COMPANY

19. Remove the bolt (1) and transmission fluid temperature sensor clamp (2), and pull out the sensor (3) from the valve body assembly.
20. Disconnect the 5 solenoid connectors (4).

Fig. 116: Valve Body Assembly

Courtesy of GENERAL MOTORS COMPANY

21. Support the valve body assembly and remove the 11 bolts (1, 2).

Specifications

- The bolts (1) size is M6 x 1.0 x 20 mm.
 - The bolts (2) size is M6 x 1.0 x 36 mm.
22. Disconnect the manual valve control rod from the manual valve lever, then remove the valve body assembly.

Fig. 117: Apply Gasket

Courtesy of GENERAL MOTORS COMPANY

23. Remove the apply gasket (1).

Fig. 118: Reverse Clutch

Courtesy of GENERAL MOTORS COMPANY

24. Using a screwdriver, remove the reverse clutch (C3) accumulator piston (1) and spring (2).
25. Remove the spring (3).

Fig. 119: 2 O-Rings

Courtesy of GENERAL MOTORS COMPANY

26. Using a screwdriver, remove the 2 O-rings (1) from the reverse clutch (C3) accumulator piston.

Fig. 120: Wiring Harness Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not damage the wiring harness and do not pull out the harness forcibly.**

27. Remove the bolt (1) and transmission wiring harness (2) from the transmission case.

Fig. 121: Transmission Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

28. Remove the O-ring (1) from the transmission wiring harness (2).
29. Remove the O-ring from the transmission fluid temperature sensor.

Fig. 122: Transmission Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not drop the differential gear assembly when the transmission housing is removed.

30. Remove the 17 transmission housing bolts (1, 2).

Specifications

- The bolts (1) size is M8 x 1.25 x 30 mm.
- The bolts (2) size is M8 x 1.25 x 30 mm (Seal).

31. Using a plastic hammer, tap the transmission housing to remove it.

Fig. 123: Measuring Input Shaft End Play
Courtesy of GENERAL MOTORS COMPANY

32. Using a dial indicator, measure the input shaft end play.

Specification

The end play is 0.3-0. mm (0.012-0.035 in).

Fig. 124: Oil Pump Assembly

Courtesy of GENERAL MOTORS COMPANY

NOTE: In some cases, the oil pump assembly may be removed with the thrust needle roller bearing attached.

33. Remove the 5 oil pump bolts (1) and oil pump (2).

Fig. 125: Differential Gear Assembly & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

34. Remove the differential gear assembly from the transmission case.

Fig. 126: Direct Clutch Assembly & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

NOTE: In some cases, the direct clutch assembly may be removed with the thrust needle roller bearing attached.

35. Remove the direct clutch assembly from the transmission case.

Fig. 127: Thrust Needle Roller Bearing & Direct Clutch Assembly
Courtesy of GENERAL MOTORS COMPANY

36. Remove the thrust needle roller bearing from the direct clutch assembly.

Fig. 128: Direct Clutch Hub, Thrust Needle Roller Bearing, Race & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

37. Remove the direct clutch hub, thrust needle roller bearing and thrust bearing race from the transmission case.

Fig. 129: Counter Driven Gear Assembly & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

38. Remove the counter driven gear assembly from the transmission case.

Fig. 130: Transmission Rear Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

39. Remove the 9 transmission rear cover bolts (1) and 1 stud bolt (2).

Fig. 131: O-Rings

Courtesy of GENERAL MOTORS COMPANY

40. Remove the 3 O-rings (1).

Fig. 132: Thrust Needle Roller Bearing
Courtesy of GENERAL MOTORS COMPANY

41. Remove the thrust needle roller bearing (1) and the forward and reverse clutch assembly (2).

Fig. 133: Thrust Needle Roller Bearing
Courtesy of GENERAL MOTORS COMPANY

42. Remove the thrust needle roller bearing (1) and thrust bearing race (2) from the forward and reverse clutch assembly.

Fig. 134: Forward Clutch Hub

Courtesy of GENERAL MOTORS COMPANY

43. Remove the forward clutch hub (1) from the transmission case.

Fig. 135: Thrust Bearing Race

Courtesy of GENERAL MOTORS COMPANY

44. Remove the thrust bearing race (1) and thrust needle roller bearing (2) from the forward clutch hub.

Fig. 136: Rear Planetary Sun Gear
Courtesy of GENERAL MOTORS COMPANY

45. Remove the rear planetary sun gear (1) from the transmission case.

Fig. 137: Thrust Bearing Race

Courtesy of GENERAL MOTORS COMPANY

46. Remove the thrust bearing race (1) from the rear planetary sun gear.

Fig. 138: Flanges, Discs And Plates
Courtesy of GENERAL MOTORS COMPANY

47. Remove 2 flanges (1, 4), 2 discs (2), and 2 plates (3) of 2nd coast and overdrive (O/D) brake from the transmission case.

Fig. 139: Front Planetary Sun Gear & Thrust Bearing Race
Courtesy of GENERAL MOTORS COMPANY

48. Remove the front planetary sun gear from the transmission case.
49. Remove the thrust bearing race from the front planetary sun gear.

Fig. 140: Thrust Needle Roller Bearing
Courtesy of GENERAL MOTORS COMPANY

50. Remove the thrust needle roller bearing (1).

Fig. 141: View Of Snap Ring

Courtesy of GENERAL MOTORS COMPANY

51. Using a screwdriver, remove the snap ring (1).

Fig. 142: Verifying Planetary Gear Turns Freely
Courtesy of GENERAL MOTORS COMPANY

52. Check that the planetary gear turns freely counterclockwise and locks clockwise.

Fig. 143: No. 2 One Way Clutch & Planetary Gear
Courtesy of GENERAL MOTORS COMPANY

NOTE: Remove the sun gear in the center while holding it.

53. Remove the No. 2 one-way clutch and planetary gear from the transmission case.

Fig. 144: No. 2 One Way Clutch, Planetary Gear & Remove Anti-Rattle Clip
Courtesy of GENERAL MOTORS COMPANY

54. Remove the No. 2 one-way clutch from the planetary gear.

Fig. 145: Outer Race Retainer

Courtesy of GENERAL MOTORS COMPANY

55. Remove the outer race retainer (1) from the transmission case.

Fig. 146: Counter Drive Gear & Parking Lock Pawl
Courtesy of GENERAL MOTORS COMPANY

56. Place the parking lock pawl in the park position to lock the counter drive gear.

Fig. 147: Counter Drive Gear Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the bearing when removing the nut.

57. Unstake the counter drive gear nut.

Fig. 148: Removing Planetary Ring Gear Nut Using DT 46472
Courtesy of GENERAL MOTORS COMPANY

58. Remove the planetary ring gear nut using **DT-46472** planetary ring gear nut removal/installation socket (1).

Fig. 149: Parking Lock Pawl Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

59. Remove the 2 parking lock pawl bracket bolts (1) and parking lock pawl bracket.

Fig. 150: Parking Lock Pawl, Shaft & Torsion Spring
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not apply too much force to the spring.

60. Remove the parking lock pawl shaft, torsion spring and parking lock pawl.

Fig. 151: Manual Detent Spring

Courtesy of GENERAL MOTORS COMPANY

61. Remove the bolt (1) and manual detent spring (2).

Fig. 152: spacer

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the manual valve lever and lever shaft.

62. Using a chisel and hammer, unstake and remove the spacer (1).

Fig. 153: Using A Pin Punch And Hammer, Driving Out Pin
Courtesy of GENERAL MOTORS COMPANY

63. Using a pin punch and hammer, drive out the pin.

Fig. 154: Manual Valve Lever & Shaft
Courtesy of GENERAL MOTORS COMPANY

64. Remove the manual valve lever shaft and manual valve lever with the parking lock rod.

Fig. 155: Parking Lock Rod

Courtesy of GENERAL MOTORS COMPANY

65. Remove the parking lock rod (1) from the manual valve lever (2).

Fig. 156: Removing Oil Seal Using A Screwdriver
Courtesy of GENERAL MOTORS COMPANY

NOTE: If using a screwdriver, use a wooden block or equivalent to avoid damaging the fitting surface of the transmission case.

66. Using a screwdriver, remove the manual valve lever oil seal.

Fig. 157: DT 46455, DT 46457, Snap Ring Of 1st & Reverse Brake
Courtesy of GENERAL MOTORS COMPANY

WARNING: Use extreme care when removing snap rings. Always wear adequate eye protection in order to avoid personal injury.

67. Using **DT-46455** brake spring compressor bolt/nut (1) and **DT-46457** 1st and reverse brake adapter (2), remove the snap ring of 1st and reverse brake.

Fig. 158: Brake No. Flange, Discs, Plates
Courtesy of GENERAL MOTORS COMPANY

68. Remove the brake no. 3 flange (1), 4 discs (2), 4 plates (3), and 1st and reverse return spring (4).

Fig. 159: Planetary Ring Gear, DT 46455, DT 46457 & DT 46459
Courtesy of GENERAL MOTORS COMPANY

69. Using **DT-46455** brake spring compressor bolt/nut (2), **DT-46457** 1st and reverse brake adapter (3), and **DT-46459** planetary ring gear remover (1), remove the planetary ring gear.

Fig. 160: Counter Drive Gear & Bolts
Courtesy of GENERAL MOTORS COMPANY

70. Install the bolts to the counter drive gear.

Specifications

- The bolt (M6) length is equal to 40-80 mm (1.57-3.15 in).
- The bolt (M6) pitch is equal to 1.0 mm (0.04 in).

71. Rotate the bolts in order and remove the counter drive gear and planetary ring gear.

Fig. 161: Applying Compressed Air To Transmission Case
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Air pressure may cause the pistons to jump out. When removing the piston, hold it in place with your hand using a waste cloth.
- Take care not to splash ATF when air-blowing.

72. Apply compressed air 392 kPa (56 psi) to the transmission case to remove the 1st and reverse brake piston.

Fig. 162: O-Rings & 1st & Reverse Brake Piston
Courtesy of GENERAL MOTORS COMPANY

73. Remove the 2 O-rings (1) from the 1st and reverse brake piston.

Fig. 163: Bolt And Transmission Case No. 1 Plate
Courtesy of GENERAL MOTORS COMPANY

74. Remove the bolt (1) and transmission case no. 1 plate (2).
75. Remove the bolt (3) and transmission case no. 2 plate (4).

Fig. 164: Transmission Case No. 2 Plate
Courtesy of GENERAL MOTORS COMPANY

76. Remove the 3 bolts (1) and oil reservoir lock plate (2) from the transmission housing.

Fig. 165: Bolt And Tube Clamp

Courtesy of GENERAL MOTORS COMPANY

77. Remove the bolt (1) and tube clamp from the transmission housing.
78. Remove the differential gear lube apply tube (2) from the transmission housing.

Fig. 166: Removing Transaxle Case Side Bearing Outer Race & Shim Using DT 46463 & DT 46465
Courtesy of GENERAL MOTORS COMPANY

79. Remove the wheel drive shaft seal from the transmission case.
80. Using **DT-46463** transmission case side bearing outer race adapter (2) and **DT-46465** adapter handle (1), remove the differential gear side outer tapered roller bearing race and shim from the transmission case.

Fig. 167: Counter Driven Gear Side Outer Tapered Roller Bearing Race
Courtesy of GENERAL MOTORS COMPANY

81. Using a suitable puller, remove the counter driven gear side outer tapered roller bearing race (1) and shim from the transmission case.

Fig. 168: Removing Side Bearing Outer Race & Transaxle Housing Using A Puller
Courtesy of GENERAL MOTORS COMPANY

82. Remove the wheel drive shaft seal from the transmission housing.
83. Using a suitable puller, remove the differential gear side outer tapered roller bearing race and shim from the transmission housing.

TRANSMISSION ASSEMBLE

Special Tools

- **J-44908** Bearing Race Installer
- **DT-45404** Transmission Indicator Alignment Tool
- **DT-46455** Brake Spring Compressor Bolt/Nut
- **DT-46456** Brake Spring Compressor Plate
- **DT-46457** 1st/Reverse Brake Adapter
- **DT-46460** Counter Drive Gear Installation Adapter
- **DT-46461** Differential Preload Adapter
- **DT-46464** Transmission Case Outer Tapered Roller Bearing Race Adapter

- **DT-46465** Adapter Handle
- **DT-46471** Transmission Housing Oil Seal Installer
- **DT-46472** Planetary Ring Gear Nut Removal/Installation Socket
- **DT-47520** Measuring Terminal
- **DT-47521** Transmission Case Oil Seal Installer
- **DT-50955** Oil Pump Oil Seal Installer

For equivalent regional tools, refer to **Special Tools**.

Assembly Procedure

Fig. 169: Transmission Housing
Courtesy of GENERAL MOTORS COMPANY

1. Install the shim to the transmission housing.
2. Using **J-44908** bearing race installer (1), install the differential gear side outer tapered roller bearing race to the transmission housing.

Fig. 170: Transmission Housing Oil Seal Installer
Courtesy of GENERAL MOTORS COMPANY

3. Using **DT-46471** transmission housing oil seal installer (1) and a hammer, install a new transmission housing oil seal.

Specification

The oil seal depth is 2.6-3.6 mm (0.102-0.142 in).

Fig. 171: J - 44908 Bearing Race Installer
Courtesy of GENERAL MOTORS COMPANY

4. Install the shim to the transmission case.
5. Using **J-44908** bearing race installer (1), install the differential gear side outer tapered roller bearing race to the transmission case.

Fig. 172: Transmission Case Oil Seal Installer
Courtesy of GENERAL MOTORS COMPANY

6. Using **DT-47521** transmission case oil seal installer (1) and a hammer, install a new transmission case oil seal.

Specification

The oil seal depth is 2.6-3.6 mm (0.102-0.142 in).

Fig. 173: Pressing In A New Outer Tapered Roller Bearing Race Using DT 46464 & DT 46465
Courtesy of GENERAL MOTORS COMPANY

7. Install the shim to the transmission case.
8. Using **DT-46464** transmission case outer tapered roller bearing race adapter (2) and **DT-46465** adapter handle (1), install the counter driven gear side outer tapered roller bearing race to the transmission case.

Fig. 174: Bolt And Tube Clamp

Courtesy of GENERAL MOTORS COMPANY

9. Install the apply tube (2) to the transmission housing.

CAUTION: Refer to Fastener Caution .

10. Install the tube clamp with the bolt (1) and tighten to 5 (44 lb in).

Fig. 175: Transmission Case No. 2 Plate
Courtesy of GENERAL MOTORS COMPANY

11. Install the oil reservoir lock plate (2) with the 3 bolts (1) and tighten to 5 (44 lb in).

Fig. 176: Bolt And Transmission Case No. 1 Plate
Courtesy of GENERAL MOTORS COMPANY

12. Install the transmission case no. 2 plate (4) and the bolt (3) and tighten to 10 (89 lb in).
13. Install the transmission case no. 1 plate (2) and the bolt (1) and tighten to 10 (89 lb in).

Fig. 177: Differential Gear & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

14. Coat the bearing on the differential case with ATF.
15. Install the differential gear to the transmission case.

Fig. 178: Transmission Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

16. Install the transmission housing and tighten the 17 bolts (1, 2) of the transmission housing temporarily.
17. Tighten 8 or 9 bolts out of 17 bolts of the transmission housing completely to tighten to 30 (22 lb ft).

Specifications

- The bolts (1) size is M8 x 1.25 x 30 mm.
- The bolts (2) size is M8 x 1.25 x 30 mm (Seal).

Fig. 179: Turning Differential Gear Assembly Right And Left Using DT-46461 Tool
Courtesy of GENERAL MOTORS COMPANY

18. Using **DT-46461** differential preload adapter, turn the differential gear assembly right and left 2 or 3 times to allow the bearing to settle.

Fig. 180: Measuring Preload Of Differential Gear
Courtesy of GENERAL MOTORS COMPANY

19. Using **DT-46461** differential preload adapter and a small torque wrench, measure the preload of the differential gear.

Specifications

- The preload for a new bearing is 0.78-1.37 (6.90-12.13 lb in).
- The preload for a reused bearing is 0.39-0.69 (3.45-6.11 lb in).

Fig. 181: Differential Gear Bearing Race Adjuster Shim
Courtesy of GENERAL MOTORS COMPANY

NOTE: When the preload is larger than the specification, select a thinner adjuster shim. When the preload is smaller than specification, select a thicker adjuster shim.

20. If the preload of the differential gear does not satisfy the specification, select the differential gear bearing race adjuster shim from the table and re-measure the value. Refer to **Transmission General Specifications**. Until the value is within the specification, repeat the procedure.

Fig. 182: View Of Counter Driven Gear
Courtesy of GENERAL MOTORS COMPANY

21. Remove the transmission housing and install the counter driven gear.

Fig. 183: Transmission Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

22. Install the transmission housing and tighten the 17 bolts of the transmission housing temporarily.
23. Tighten 8 or 9 bolts out of 17 bolts of the transmission housing completely to tighten to 30 (22 lb ft).

Specifications

- The bolts (1) size is M8 x 1.25 x 30 mm.
- The bolts (2) size is M8 x 1.25 x 30 mm (Seal).

Fig. 184: Turning Differential Gear Assembly Right And Left Using DT-46461 Tool
Courtesy of GENERAL MOTORS COMPANY

24. Using **DT-46461** differential preload adapter, turn the differential gear assembly right and left 2 or 3 times to allow the bearing to settle.

Fig. 185: Measuring Preload Of Differential Gear
Courtesy of GENERAL MOTORS COMPANY

25. Using **DT-46461** differential preload adapter and a small torque wrench, measure the preload of the differential gear.

Specifications

- The preload for a new bearing is 0.33-0.76 (2.92-6.73 lb in).
- The preload for a reused bearing is 0.17-0.38 (1.50-3.36 lb in).

Fig. 186: Counter Driven Gear Bearing Race Adjuster Shim
Courtesy of GENERAL MOTORS COMPANY

NOTE: When the preload is larger than the specification, select a thinner adjuster shim. When the preload is smaller than specification, select a thicker adjuster shim.

26. If the above measured preload does not satisfy the specification, select the counter driven gear bearing race adjuster shim from the table and re-measure the value. Refer to **Transmission General Specifications**. Until the value is within the specification, repeat the procedure.

Fig. 187: Measuring Free Length Of 1st And Reverse Brake Piston Return Spring
Courtesy of GENERAL MOTORS COMPANY

27. Using the vernier calipers, measure the free length of the 1st and reverse brake piston return spring.

Specification

The standard free length is 18.93 mm (0.7452 in).

Fig. 188: Inspecting Sliding Surface Of Disc
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- If the lining of the disc is peeling off or discolored, or even if a part of the groove is defaced, replace all discs.
- Before assembling the new discs, soak them in ATF for at least 15 minutes.

28. Inspect the sliding surface of the disc, the plate and the flange of the 1st and reverse brake for wear or burn. Replace if necessary.

Fig. 189: O-Rings & 1st & Reverse Brake Piston
Courtesy of GENERAL MOTORS COMPANY

29. Coat the new O-rings (1) with ATF and install the O-rings to the 1st and reverse piston.

Fig. 190: 1st & Reverse Brake Piston
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the O-rings of the 1st and reverse brake piston.

30. Install the 1st and reverse brake piston to the transmission case.

Fig. 191: Return Spring & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

31. Install the return spring to the transmission case.

Fig. 192: Plates, 4 Discs And Flange
Courtesy of GENERAL MOTORS COMPANY

32. Install the 4 plates (1), the 4 discs (2) and the flange (3).

Fig. 193: DT 46455, DT 46457, Snap Ring Of 1st & Reverse Brake
Courtesy of GENERAL MOTORS COMPANY

NOTE: Verify that the snap ring is installed correctly in the groove of the transmission case.

33. Using **DT-46457** 1st/reverse brake adapter (2) and **DT-46455** Brake Spring Compressor Bolt/Nut (1), install the snap ring.

Fig. 194: DT -- 47520 Measuring Terminal
Courtesy of GENERAL MOTORS COMPANY

NOTE: If the piston stroke is non-standard, inspect the discs, the plates and the flange. The piston stroke is 0.65-1.05 mm (0.025-0.041 in).

34. Using a dial indicator and **DT-47520** measuring terminal, measure the 1st and reverse brake piston stroke while applying and releasing compressed air 392 kPa (56 psi) (1).

Fig. 195: DT 46460, DT 46455 & DT 46456
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not apply excessive force to the transmission case.**

35. Using **DT-46460** counter drive gear installation adapter (3), **DT-46455** brake spring compressor bolt/nut tool (2) and **DT-46456** brake spring compressor plate (1), install the counter drive gear.

Fig. 196: Transaxle Housing & Counter Driven Gear
Courtesy of GENERAL MOTORS COMPANY

36. Coat a new manual valve lever oil seal with ATF.
37. Install the manual valve lever oil seal to the transmission case.

Specification

The oil seal depth is 0.75-1.25 mm (0.030-0.049 in).

Fig. 197: Parking Lock Rod

Courtesy of GENERAL MOTORS COMPANY

38. Install the parking lock rod (1) to the manual valve lever (2).

Fig. 198: Manual Valve Lever

Courtesy of GENERAL MOTORS COMPANY

39. Install a new spacer (1) to the manual valve lever (2).

Fig. 199: Manual Valve Lever & Shaft
Courtesy of GENERAL MOTORS COMPANY

40. Install the manual valve lever shaft and the manual valve lever.

Fig. 200: Using A Pin Punch And Hammer, Driving Out Pin
Courtesy of GENERAL MOTORS COMPANY

41. Using a pin punch and hammer, drive in a new pin.

Fig. 201: Staking Spacer Through Small Hole
Courtesy of GENERAL MOTORS COMPANY

42. Turn the spacer and the lever shaft to align the small hole for locating the staking position in the spacer with the staking position mark on the lever shaft.
43. Using a pin punch, stake the spacer through the small hole.
44. Verify that the spacer does not turn.

Fig. 202: Manual Detent Spring

Courtesy of GENERAL MOTORS COMPANY

45. Install the manual detent spring (2).
46. Install the manual detent spring bolt (1) and tighten to 10 (89 lb in).

Fig. 203: Parking Lock Pawl, Shaft & Torsion Spring
Courtesy of GENERAL MOTORS COMPANY

47. Install the parking lock pawl shaft, torsion spring, and the parking lock pawl.

Fig. 204: Edge Of Torsion Spring
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not apply too much force to the spring.

48. Verify that the edge of the torsion spring fits into the groove securely.

Fig. 205: Parking Lock Pawl Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

49. Install the parking lock pawl bracket.
50. Install the parking lock pawl bolts (1) and tighten to 7 (62 lb in).

Fig. 206: DT 46460, DT 46455 & Planetary Ring Gear
Courtesy of GENERAL MOTORS COMPANY

51. Replace the planetary ring gear flange of the planetary ring gear with a new one.
52. Using **DT-46460** counter drive gear installation adapter (2) and **DT-46455** brake spring compressor bolt/nut tool (1), install the planetary ring gear.

Fig. 207: Counter Drive Gear & Parking Lock Pawl
Courtesy of GENERAL MOTORS COMPANY

53. Fix the counter drive gear with the parking lock pawl.

Fig. 208: Removing Planetary Ring Gear Nut Using DT 46472
Courtesy of GENERAL MOTORS COMPANY

NOTE: Tightening torque value is a reference value and must ensure that the tightening torque in the next step.

54. Using **DT-46472** planetary ring gear nut removal/installation socket (1), install a new nut and tighten to 115 (85 lb ft).

Fig. 209: Turning The Counter Drive Gear Using A Wrench
Courtesy of GENERAL MOTORS COMPANY

55. Using a small torque wrench, turn the counter drive gear 100 turn per minute and measure the preload.

Specification

When the preload is smaller than the specification, tighten the nut more and adjust the preload to 0.05-0.35 (0.43-3.12 lb in).

56. Inspect the rotation of the counter drive gear is smooth.

Fig. 210: Counter Drive Gear Nut
Courtesy of GENERAL MOTORS COMPANY

57. Using a chisel and a hammer, stake the counter drive gear nut.

Fig. 211: Planetary Gear & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

58. Install the planetary gear to the transmission case.

Fig. 212: No. 2 One-Way Clutch & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

59. Install the No. 2 one-way clutch to the transmission case.

Fig. 213: Verifying Planetary Gear Turns Freely
Courtesy of GENERAL MOTORS COMPANY

60. Verify that the planetary gear turns freely counterclockwise and locks clockwise.

Fig. 214: Outer Race Retainer

Courtesy of GENERAL MOTORS COMPANY

61. Install the outer race retainer (1) in the space between No. 2 one-way clutch outer race and transmission case, push the outer race retainer in until you hear the click.

Fig. 215: View Of Snap Ring

Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure that the snap ring is installed in the groove of the transmission case correctly.

62. Using a screwdriver, install the snap ring (1).

Fig. 216: Thrust Needle Roller Bearing
Courtesy of GENERAL MOTORS COMPANY

NOTE: Verify the direction of the bearing.

63. Install the thrust needle roller bearing (1).

Fig. 217: Thrust Bearing Race & Front Planetary Sun Gear
Courtesy of GENERAL MOTORS COMPANY

64. Coat the thrust bearing race with petroleum jelly and install the race onto the front planetary sun gear.

Fig. 218: Front Planetary Sun Gear & Thrust Bearing Race
Courtesy of GENERAL MOTORS COMPANY

65. Install the front planetary sun gear to the transmission case.

Fig. 219: Inspecting Sliding Surface Of Disc
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- If the lining of the disc is peeling off or discolored, or even if a part of the printed mark is defaced, replace all discs.
- Before assembling the new discs, soak the discs in ATF for at least 15 minutes.

66. If the sliding surface of the disc, the plate and the flange of O/D and 2nd coast brake are worn or burnt, replace the parts.

Fig. 220: Flanges, Discs And Plates
Courtesy of GENERAL MOTORS COMPANY

67. Install 2 flanges (1, 4), 2 discs (2), and 2 plates (3) of O/D and 2nd coast brake to the transmission case.

Fig. 221: Rear Planetary Sun Gear
Courtesy of GENERAL MOTORS COMPANY

68. Install the rear planetary sun gear (1) to the transmission case.

Fig. 222: Thrust Bearing Race

Courtesy of GENERAL MOTORS COMPANY

NOTE: **Verify the direction of the race.**

69. Coat the thrust bearing race (1) with petroleum jelly and install it onto the transmission case.

Fig. 223: Thrust Needle Roller Bearing
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Verify the direction of the bearing.**

70. Coat the thrust needle roller bearing (1) with petroleum jelly and install it onto the forward clutch hub.

Fig. 224: Forward Clutch Hub

Courtesy of GENERAL MOTORS COMPANY

71. Install the forward clutch hub (1) to the transmission case.

Fig. 225: Thrust Bearing Race

Courtesy of GENERAL MOTORS COMPANY

72. Coat the thrust bearing race (1) with petroleum jelly and install it onto the forward clutch hub.

Fig. 226: Thrust Needle Roller Bearing
Courtesy of GENERAL MOTORS COMPANY

73. Install the thrust bearing race (2) and thrust needle roller bearing (1) to the forward and reverse clutch assembly.

Fig. 227: Reverse Clutch Assembly
Courtesy of GENERAL MOTORS COMPANY

74. Install the forward and reverse clutch assembly (1) to the transmission case.

Fig. 228: Thrust Needle Roller Bearing & Forward/Reverse Clutch Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: Verify the direction of the bearing.

75. Coat the thrust needle roller bearing with petroleum jelly and install it onto the forward and reverse clutch assembly.
76. Clean the connected part of the transmission case and rear cover.

Fig. 229: Measuring Distance (a) Between 2Nd Coast And O/D Brake Flange
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Note down the measured value.**

77. Place a straight edge on the transmission case and measure the distance (a) between the 2nd coast and the O/D brake flange and the straight edge using vernier calipers.

Fig. 230: Measuring Distance (B) Between Transmission Rear Cover And Straight Edge
Courtesy of GENERAL MOTORS COMPANY

78. Place a straight edge on the O/D brake piston and measure the distance (b) between the transmission rear cover and the straight edge using vernier calipers.
79. Calculate the piston stroke value using the following formula:

Piston stroke = Dimension a - Dimension b.

Select and install a flange which satisfies the piston stroke value.

Specification

The piston stroke is 0.65-1.05 mm (0.025-0.041 in).

80. If the piston stroke is out of standard, select another flange. Refer to **Transmission General Specifications**.

Fig. 231: O-Rings

Courtesy of GENERAL MOTORS COMPANY

81. Install new 3 O-rings (1) to the transmission rear cover.

Fig. 232: Transmission Rear Cover
Courtesy of GENERAL MOTORS COMPANY

82. Remove any packing material. Do not get oil on the contacting surfaces of the transmission rear cover or transmission case.
83. Apply three bond 1281 or equivalent to the transmission case.

Fig. 233: Transmission Rear Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

84. Install the transmission rear cover to the transmission case.
85. Install the 9 transmission rear cover bolts (1) and 1 stud bolt (2) and tighten to 25 (18 lb ft).

Fig. 234: Counter Driven Gear Assembly & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

86. Install the counter driven gear assembly to the transmission case.

Fig. 235: Differential Gear Assembly & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

87. Install the differential gear assembly to the transmission case.

Fig. 236: Direct Clutch Hub & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

88. Install the direct clutch hub to the transmission case.

Fig. 237: Thrust Bearing Race
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Verify the direction of the bearing.**

89. Install the thrust bearing race and the thrust needle roller bearing to the transmission case.

Fig. 238: Direct Clutch Assembly & Transaxle Case
Courtesy of GENERAL MOTORS COMPANY

90. Install the direct clutch assembly to the transmission case.

Fig. 239: Thrust Needle Roller Bearing
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Verify the direction of the bearing.**

91. Install the thrust needle roller bearing to the transmission case.
92. Place the oil pump through the input shaft, and align the bolt holes of the oil pump with the transmission case.

Fig. 240: Oil Pump Assembly

Courtesy of GENERAL MOTORS COMPANY

93. Install the 5 oil pump bolts (1) and tighten to 25 (18 lb ft).

Fig. 241: Measuring Input Shaft End Play
Courtesy of GENERAL MOTORS COMPANY

94. Measure the end play in axial direction.

Specification

The end play is 0.3-0.9 mm (0.012-0.035 in).

Fig. 242: Input Shaft Rotates Smoothly
Courtesy of GENERAL MOTORS COMPANY

95. Confirm that the input shaft rotates smoothly.

Fig. 243: Removing Any Packing Material
Courtesy of GENERAL MOTORS COMPANY

96. Remove any packing material. Do not get oil on the contacting surfaces of the transmission housing or the transmission case.
97. Apply three bond 1281 or equivalent to the transmission case.

Fig. 244: Transmission Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

98. Install the transmission housing to the transmission case.
99. Apply seal packing or equivalent to the 4 bolts (2).
100. Install the transmission housing bolts (1, 2) and tighten to 30 (22 lb ft).

Specifications

- The bolts (1) size is M8 x 1.25 x 30 mm.
- The bolts (2) size is M8 x 1.25 x 30 mm (Seal).

Fig. 245: Identifying DT - 50955 Oil Pump Seal Installer And A Hammer
Courtesy of GENERAL MOTORS COMPANY

101. Using **DT-50955** oil pump oil seal installer (1) and a hammer, drive in a new oil seal.
102. Coat the lip of oil seal with the grease.

Fig. 246: Transmission Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

103. Coat a new O-ring (1) with ATF and install it to the transmission wiring harness (2).
104. Coat a new O-ring with ATF and install it to the transmission fluid temperature sensor.

Fig. 247: Wiring Harness Assembly
Courtesy of GENERAL MOTORS COMPANY

105. Install the transmission wiring harness (2) to the transmission case.
106. Install the transmission wiring harness bolt (1) and tighten to 5 (44 lb in).

Fig. 248: 2 O-Rings

Courtesy of GENERAL MOTORS COMPANY

107. Coat new 2 O-rings (1) with ATF and install them to the piston.

Fig. 249: Reverse Clutch

Courtesy of GENERAL MOTORS COMPANY

108. Coat the spring (2, 3) and reverse clutch (C3) accumulator piston (1) with ATF, install them to the hole.

Fig. 250: Apply Gasket

Courtesy of GENERAL MOTORS COMPANY

109. Coat a new apply gasket (1) with ATF, install it to the transmission case.

Fig. 251: Manual Valve Control Rod And Manual Lever
Courtesy of GENERAL MOTORS COMPANY

110. Connect the manual valve control rod (2) to the manual valve lever (1).

Fig. 252: Valve Body Assembly

Courtesy of GENERAL MOTORS COMPANY

NOTE: When installing the valve body to the transmission case, do not let the accumulator piston incline. When installing the valve body to the transmission case, do not hold the solenoid.

111. Install the valve body assembly to the transmission case.
112. Install the 11 valve body bolts (1, 2) and tighten to 11 (97 lb in).

Specifications

- The bolts (1) size is M6 x 1.0 x 20 mm.
- The bolts (2) size is M6 x 1.0 x 36 mm.

Fig. 253: Transmission Fluid Temperature Sensor Clamp
Courtesy of GENERAL MOTORS COMPANY

NOTE: Verify that the transmission wiring harness does not come out from the oil pan installations surface.

113. Connect the 5 connectors (4).
114. Install the transmission fluid temperature sensor (3) with the clamp (2).
115. Install the transmission fluid temperature sensor bolt (1) and tighten to 7 (62 lb in)

Fig. 254: Oil Strainer

Courtesy of GENERAL MOTORS COMPANY

116. Install a new O-ring (1) to the oil strainer.

Fig. 255: Oil Strainer

Courtesy of GENERAL MOTORS COMPANY

117. Install the oil strainer (1) to the valve body.

Fig. 256: View Of Magnets

Courtesy of GENERAL MOTORS COMPANY

118. Install the 4 magnets (1) in the oil pan.

Fig. 257: Oil Pan And Oil Pan Gasket
Courtesy of GENERAL MOTORS COMPANY

119. Install a new gasket to the oil pan (2) and install the oil pan to the transmission case.
120. Install the 17 oil pan bolts (1) and tighten to 7 (62 lb in).

Fig. 258: Drain Plug Gasket

Courtesy of GENERAL MOTORS COMPANY

NOTE: Be sure to install the gasket in the correct direction.

121. Install a new drain plug gasket (1) with ATF and install it to the drain plug bolt (2).
122. Install the drain plug and tighten to 17 (13 lb ft).

Fig. 259: View Of Plug Gasket

Courtesy of GENERAL MOTORS COMPANY

NOTE: Be sure to install the gasket in the correct direction.

123. Install the overflow plug (2) and a new gasket (1) and tighten to 24 (18 lb ft).

Fig. 260: Transmission Hook Nut
Courtesy of GENERAL MOTORS COMPANY

124. Install the hook (2) and transmission hook nut (1) and tighten to 17 (13 lb ft).

Fig. 261: Input Speed Sensor

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not install the speed sensor on the opposite side of the input and output.

125. Install the output speed sensor (4).
126. Install the output speed sensor bolt (3) and tighten to 5 (44 lb in).
127. Install the input speed sensor (2) and tighten to 5 (44 lb in).

Fig. 262: Breather Plug Bracket

Courtesy of GENERAL MOTORS COMPANY

128. Coat a new O-ring with ATF, install it to the breather plug.
129. Install the breather plug to the transmission.
130. Install the breather hose (3) with the clamp to the breather plug.
131. Install the breather bracket (2) with a bolt and tighten to 5 (44 lb in).

Fig. 263: Park/Neutral Position (PNP) Switch
Courtesy of GENERAL MOTORS COMPANY

NOTE: The park/neutral position (PNP) switch is inserted into the manual valve lever shaft by press fitting. Do NOT reuse the PNP switch once the switch is removed from the shaft. The used PNP switch may cause detection failure of position since the holding part of the used switch is deformed.

132. Install a NEW park/neutral position (PNP) switch onto the manual valve lever shaft and temporarily install the 2 adjusting bolts (1).

Fig. 264: View Of Range Selector Lever
Courtesy of GENERAL MOTORS COMPANY

133. Install the control lever temporarily and move to N (neutral) position.
134. Remove the control lever.

Fig. 265: Selector Lever Shaft With Neutral Basic Line
Courtesy of GENERAL MOTORS COMPANY

135. Install **DT-45404** transmission indicator alignment tool to the manual shaft.
136. Align the groove on the switch with the indicator line on DT-45404.

Fig. 266: Spring Washer And Control Shaft Lever
Courtesy of GENERAL MOTORS COMPANY

- 137. Install the 2 bolts (3) and tighten to 5 (44 lb in).
- 138. Remove DT-45404 from the manual shaft.
- 139. Install the control lever (2), washer and nut (1) and tighten to 12 (106 lb in).

Fig. 267: Torque Converter

Courtesy of GENERAL MOTORS COMPANY

- 140. Install the torque converter (2) to the transmission housing (1).
- 141. Measure the installation depth (a) of the torque converter.

Specification

The standard value is 26.525 mm (1.044 in).

- 142. If the measured value is out of the standard value, readjust the torque converter within the specified value.

TRANSMISSION WIRING HARNESS INSPECTION

Transmission Fluid Temperature Sensor

Inspection 1

Fig. 268: Transmission Fluid Temperature (TFT) sensor
Courtesy of GENERAL MOTORS COMPANY

1. Warm up ATF and insert the transmission fluid temperature (TFT) sensor in ATF.
2. Measure the resistance between the transmission wiring harness connector terminals 1 and 7 at 10°C (50°F) and 110°C (230°F).
3. If the resistance measurement of 10°C (50°F) is not between 5.626-7.303 kohms, replace the TFT sensor.
4. If the resistance measurement of 110°C (230°F) is not between 0.224-0.271 kohms, replace the TFT sensor.

Inspection 2

With a tester, check for continuity between each of the connector terminal combinations as the specification.

Specification

Continuity between the terminal 1 (OT) or 7 (OTG) and ground is no.

Shift Solenoid (S1)

Inspection 1

Using a tester, measure the resistance between the transmission wiring harness connector terminal 10 and the body ground.

Specification

The resistance at 20°C (68°F) is between 11-15 ohms.

Linear Solenoid (SLC1, SLC2, SLB1, SLU)

Inspection 1

Using a tester, measure the resistance between the control circuit terminal and the low reference circuit terminal for each solenoid from the transmission wiring harness.

Specification

The resistance at 20°C (68°F) is between 5.0-5.6 ohms.

Inspection 2

Using a tester, check for continuity between each terminal of the transmission wiring harness connector and the body ground.

Specification

Continuity between each terminal and body ground is no.

OIL PUMP DISASSEMBLE

Fig. 269: O-Ring From And Oil Pum
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not damage the oil seal lip.**

1. Remove the O-ring from the oil pump.

NOTE: **Do not damage the bushing on the oil pump.**

2. Remove the oil seal from the oil pump.

OIL PUMP INSPECTION

Fig. 270: Measuring Inside Diameter Of Oil Pump Bushing
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: Measure at the different places and take an average. If the measurement is greater than the maximum, replace the oil pump. When the oil pump is replaced, inspect the contact surface opposed to the torque converter. If the surface is scratched or has changed the color, replace the torque converter with a new one.

1. Using a dial indicator, measure the inside diameter of the oil pump bushing.

Specification

The standard inside diameter is 38.113-38.138 mm (1.5005-1.5014 in).

Fig. 271: Measuring Inside Diameter Of Stator Shaft Bushings
Courtesy of GENERAL MOTORS COMPANY

2. Using a dial indicator, measure the inside diameter of the stator shaft bushings.

Specification

The standard inside diameter is 17.124-17.150 mm (0.6741-0.6751 in).

OIL PUMP ASSEMBLE

Special Tools

DT-50955 (DW240-110) Oil Pump Seal Installer

For equivalent regional tools, refer to **Special Tools**.

Fig. 272: Identifying DT - 50955 Oil Pump Seal Installer And A Hammer
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the oil seal.

1. Using **DT-50955** oil pump seal installer and a hammer, install a new oil seal to the oil pump.

Specification

The oil seal in depth is 0 mm (0 in).

2. Coat a new O-ring with ATF.
3. Install the O-ring on the oil pump.

Fig. 273: Turning Drive Gear With 2 Screwdrivers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the oil seal lip.

4. Turn the drive gear with 2 screwdrivers and make sure it rotates smoothly.

DIRECT CLUTCH ASSEMBLY DISASSEMBLE

Special Tools

DT-46453 (DW240-040) Direct Clutch Adapter

For equivalent regional tools, refer to **Special Tools**.

Fig. 274: Identifying Snap Ring

Courtesy of GENERAL MOTORS COMPANY

1. Using a screwdriver, remove the snap ring (1).

Fig. 275: Flange, 2 Discs And Plates

Courtesy of GENERAL MOTORS COMPANY

2. Remove the flange (1), 2 discs (2), and 2 plates (3).

Fig. 276: View Of DT-46453 Direct Clutch Adapter On Clutch No. 2 Balancer
Courtesy of GENERAL MOTORS COMPANY

3. Place **DT-46453** direct clutch adapter on the clutch no. 2 balancer and compress the direct clutch return spring with a press.

NOTE: **Do not expand the snap ring excessively.**

4. Using a snap ring expander, remove the snap ring.

Fig. 277: Direct Clutch No. 2 Balancer
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the seal on the clutch no. 2 balancer.

5. Remove the direct clutch no. 2 balancer (1).

Fig. 278: Direct Clutch Return Spring
Courtesy of GENERAL MOTORS COMPANY

6. Remove the direct clutch return spring (1).

Fig. 279: Direct Clutch On Oil Pump
Courtesy of GENERAL MOTORS COMPANY

7. Install the direct clutch on the oil pump.

NOTE:

- Air pressure may cause the piston to jump out. When removing the piston, hold it with your hand using a waste cloth.
- Take care not to splash ATF when air-blowing.
- When the piston cannot be removed as it is slanted, either blow the air again with the protruding side pushed or remove the piston using the needle nose pliers with vinyl tape on the tip.

8. Apply compressed air 392 kPa (56 psi) to the oil pump to remove the direct clutch piston.

Fig. 280: O-Ring And Direct Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

9. Using a small screwdriver, remove the O-ring (1) from the direct clutch piston.

Fig. 281: O-Ring (And Input Shaft
Courtesy of GENERAL MOTORS COMPANY

10. Remove the O-ring (1) from the input shaft.

Fig. 282: Seal Rings And Input Shaft
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not expand the ring ends excessively.

11. Remove the 2 oil seal rings (1) from the input shaft.

DIRECT CLUTCH INSPECTION

Fig. 283: Inspecting Sliding Surface Of Disc
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Safety Glasses Warning .

1. Check the lining of all discs.
 - If the lining of the disc is peeling off or discolored, or even if a part of the printed number is defaced, replace all discs.
 - Before assembling new discs, soak them in ATF for at least 15 minutes.

Fig. 284: Measuring Free Length Of Return Spring
Courtesy of GENERAL MOTORS COMPANY

NOTE: If the free length is smaller than the minimum, replace the return spring with a new one.

2. Using vernier calipers, measure the free length of the return spring.

Specification

Standard free length is 23.74 mm (0.935 in).

DIRECT CLUTCH ASSEMBLY ASSEMBLE

Special Tools

DT-46453 (DW240-040) Direct Clutch Adapter

For equivalent regional tools, refer to **Special Tools**.

Fig. 285: Seal Rings And Input Shaft
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Do not expand the oil seal rings excessively.
- Do not shorten the oil seal rings too much, when installing the oil seal rings.

1. Coat the 2 new oil seal rings (1) and sliding surface of the input shaft with ATF.
2. Compress the 2 oil seal rings, then install the oil seal rings to the input shaft.
3. Check that the oil seal rings rotate smoothly after installing them.

Fig. 286: O-Ring (And Input Shaft
Courtesy of GENERAL MOTORS COMPANY

4. Coat a new O-ring (1) and the input shaft with ATF.
5. Install the O-ring to the input shaft.

Fig. 287: O-Ring And Direct Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

6. Coat a new O-ring (1) and the direct clutch piston with ATF.
7. Install the O-ring to the direct clutch piston.

Fig. 288: Direct Clutch On Oil Pump
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the seal of the direct clutch piston and O-ring.

8. Coat the sliding surface of the direct clutch piston with ATF.
9. Install the direct clutch piston to the direct clutch drum.

Fig. 289: Direct Clutch Return Spring
Courtesy of GENERAL MOTORS COMPANY

10. Install the direct clutch return spring (1).

Fig. 290: Direct Clutch No. 2 Balancer
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the seal on the clutch no. 2 balancer.

11. Install the direct clutch balancer (1).

Fig. 291: View Of DT-46453 Direct Clutch Adapter On Clutch No. 2 Balancer
Courtesy of GENERAL MOTORS COMPANY

12. Place **DT-46453** direct clutch adapter on the return spring and compress the return spring with a press.

NOTE:

- When installing the snap ring, set the end gap of the snap ring facing on the mark.
- Do not expand the snap ring too much.

13. Using a snap ring expander, install the snap ring.

Fig. 292: Flange, 2 Discs And Plates

Courtesy of GENERAL MOTORS COMPANY

NOTE: Check the number and order of flange, discs and plates.

14. Install the 2 plates (3), 2 discs (2), and the flange (1).

Fig. 293: Identifying Snap Ring

Courtesy of GENERAL MOTORS COMPANY

15. Using a screwdriver, install the snap ring (1) in the groove.
16. Check that the end gap of the snap ring is not aligned with one of the cutouts.

Fig. 294: Direct Clutch On Oil Pump
Courtesy of GENERAL MOTORS COMPANY

17. Install the direct clutch (1) on the oil pump.
18. Using a dial indicator, measure the direct clutch piston stroke while applying and releasing compressed air 392 kPa (56 psi).

Specification

The piston stroke is 0.4-0.7 mm (0.016-0.028 in).

19. If the piston stroke is not within the specified range, select an appropriate flange.

Specifications

- The number 1 flange thickness is 2.8 mm (0.110 in).
- The number 2 flange thickness is 3.0 mm (0.118 in).
- The number 3 flange thickness is 3.2 mm (0.126 in).

FORWARD AND REVERSE CLUTCH DISASSEMBLE

Special Tools

- **DT-46451 (DW240-020)** Brake/Clutch Spring Compressor
- **DT-46453 (DW240-040)** Direct Clutch Adapter

For equivalent regional tools, refer to **Special Tools**.

Fig. 295: Reverse Clutch Snap Ring
Courtesy of GENERAL MOTORS COMPANY

1. Using a screwdriver, remove the reverse clutch snap ring (1).

Fig. 296: Flange, Discs And Plates

Courtesy of GENERAL MOTORS COMPANY

2. Remove the flange (1), the 2 discs (2), the 2 plates (3), and the cushion plate (4) from the reverse clutch drum.

Fig. 297: Snap Ring And Groove

Courtesy of GENERAL MOTORS COMPANY

3. Using a screwdriver, remove the snap ring (1).

Fig. 298: Identifying Flange And Discs
Courtesy of GENERAL MOTORS COMPANY

4. Remove the flange (1), 4 discs (2), and 4 plates (3) from the forward clutch drum.

Fig. 299: Compressing Spring Using DT 46451 & DT 46452
Courtesy of GENERAL MOTORS COMPANY

5. Using **DT-46451** spring compressor (1) and **DT-46453** clutch adapter (2), compress the return spring.

NOTE: Do not expand the snap ring excessively.

6. Using a snap ring expander, remove the snap ring.

Fig. 300: Clutch Balancer

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the seal on the clutch balancer.

7. Remove the clutch balancer (1) and forward clutch return spring (2).

Fig. 301: Intermediate Shaft

Courtesy of GENERAL MOTORS COMPANY

8. Install the intermediate shaft on the transmission rear cover.

NOTE:

- Air pressure may cause the piston to jump out. When removing the piston, hold it with your hand using a waste cloth.
- Take care not to splash ATF when air-blowing.
- When the piston cannot be removed as it is slanted, either blow the air again with the protruding side pushed or remove the piston using the needle nose pliers with vinyl tape on the tip.

9. Apply compressed air 392 kPa (56 psi) to the transmission rear cover to remove the forward clutch piston.

Fig. 302: Applying Compressed Air To Transmission Rear Cover
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Air pressure may cause the drum to jump out. When removing the drum, hold it with your hand using a waste cloth.
- Take care not to splash ATF when air-blowing.
- When the drum cannot be removed as it is slanted, either blow the air again with the protruding side pushed or remove the drum using the needle nose pliers with vinyl tape on the tip.

10. Apply compressed air 392 kPa (56 psi) to the transmission rear cover to remove the forward clutch drum.

Fig. 303: Identifying O-Ring And Clutch Drum
Courtesy of GENERAL MOTORS COMPANY

11. Remove the O-ring (1) from the forward clutch drum.

Fig. 304: O-Ring And Intermediate Shaft
Courtesy of GENERAL MOTORS COMPANY

12. Remove the O-ring (1) from the intermediate shaft.

FORWARD AND REVERSE CLUTCH INSPECTION

Fig. 305: Inspecting Sliding Surface Of Disc
Courtesy of GENERAL MOTORS COMPANY

1. Check the lining of all discs.
 - If the lining of the disc is peeling off or discolored, or even if a part of the printed number is defaced, replace all discs.
 - Before assembling new discs, soak them in ATF for at least 15 minutes.

Fig. 306: Measuring Free Length Of Return Spring
Courtesy of GENERAL MOTORS COMPANY

2. Using vernier calipers, measure the free length of the return spring.

Specifications

The standard free length is 20.88 mm (0.822 in).

FORWARD AND REVERSE CLUTCH ASSEMBLE

Special Tools

- **DT-46451 (DW240-020)** Brake/Clutch Spring Compressor
- **DT-46453 (DW240-040)** Direct Clutch Adapter
- **DT-47520 (DW240-120)** Measuring Terminal

Fig. 307: O-Ring And Intermediate Shaft
Courtesy of GENERAL MOTORS COMPANY

1. Coat a new O-ring (1) with (ATF) and install it to the intermediate shaft.

Fig. 308: Identifying O-Ring And Clutch Drum
Courtesy of GENERAL MOTORS COMPANY

2. Coat a new O-ring (1) with ATF, and install it to the forward clutch drum.

Fig. 309: Identifying Clutch Drum With ATF
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the O-ring and seal of forward clutch drum.

3. Coat the forward clutch drum with ATF, install the forward clutch drum.

Fig. 310: Clutch Piston With ATF
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not damage the seal of the forward clutch piston.**

4. Coat the forward clutch piston with ATF, install the forward clutch piston.

Fig. 311: Clutch Balancer

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the seal of the forward clutch return spring.

5. Install the forward clutch return spring (2) and clutch balancer (1).

Fig. 312: Compressing Spring Using DT 46451 & DT 46452
Courtesy of GENERAL MOTORS COMPANY

6. Place **DT-46451** brake/clutch spring compressor (1) and **DT-46453** clutch adapter (2) on the clutch balancer and compress the piston return spring.

NOTE: **Do not expand the snap ring excessively.**

7. Using a snap ring expander, install the snap ring.

Fig. 313: Identifying Flange And Discs
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Check the number and order of the flange, discs, and the plates.
- Install the same thickness flange as when it is removed.

8. Install the 4 plates (3), 4 discs (2), and the flange (1).

Fig. 314: Snap Ring And Groove

Courtesy of GENERAL MOTORS COMPANY

9. Using a screwdriver, install the snap ring (1) in the groove.
10. Verify that the end gap of the snap ring is not aligned with one of the cutouts.

Fig. 315: Flange, Discs And Plates

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Check the number and order of the flange, discs, and the plates.
- Install the same thickness flange as when it is removed.

11. Install the cushion plate (4), the 2 plates (3), the 2 discs (2), and the flange (1).

Fig. 316: Reverse Clutch Snap Ring
Courtesy of GENERAL MOTORS COMPANY

12. Using a screwdriver, install the snap ring (1) in the groove.
13. Verify that the end gap of the snap ring is not aligned with one of the cutouts.

Fig. 317: Measuring Reverse Clutch Piston Stroke
Courtesy of GENERAL MOTORS COMPANY

14. Install the forward and reverse clutch and thrust needle roller bearing on the transmission rear cover.
15. Using a dial indicator, measure the reverse clutch piston stroke while applying and releasing compressed air 392 kPa (56 psi).
16. If the piston stroke is not within the specified range, select an appropriate flange.
 - If the piston stroke is longer than the upper range, install the thicker flange and measure again.
 - The piston stroke is not within the specified range even if changing to the thickest flange, replace the reverse clutch assembly.
 - If the piston stroke is shorter than the lower range, install the thinner flange and measure again.
 - The piston stroke is not within the specified range even if changing to the thinnest flange, replace the reverse clutch assembly.

Specification

The piston stroke is 1.2-1.6 mm (0.047-0.063 in).

- There are 4 flanges in different thickness.

Specifications

- The number 1 flange thickness is 3 mm (0.118 in).
- The number 2 flange thickness is 3.2 mm (0.126 in).
- The number 3 flange thickness is 3.4 mm (0.134 in).
- The number 4 flange thickness is 3.6 mm (0.142 in).

Fig. 318: Identifying DT-- 47520 Measuring Terminal
 Courtesy of GENERAL MOTORS COMPANY

17. Using a dial indicator and **DT-47520** measuring terminal (1), measure the forward clutch piston stroke while applying and releasing compressed air 392 kPa (56 psi).
18. If the piston stroke is not within the specified range, select an appropriate flange.
 - If the piston stroke is longer than the upper range, install the thicker flange and measure again.
 - The piston stroke is not within the specified range even if changing to the thickest flange, replace the reverse clutch assembly.
 - If the piston stroke is shorter than the lower range, install the thinner flange and measure again.
 - The piston stroke is not within the specified range even if changing to the thinnest flange, replace the reverse clutch assembly.
 - The forward and reverse clutch will come out as you apply the compressed air. Therefore, while the checking is being done, press on the input shaft of the forward and reverse clutch using stamping machine or alike so that the pressure is not applied on the forward and reverse clutch.

Specification

The piston stroke is 0.8-1.0 mm (0.031-0.039 in).

- There are 9 flanges in different thickness.

Specifications

- The number 1 flange thickness is 3 mm (0.118 in).
- The number 2 flange thickness is 3.1 mm (0.122 in).
- The number 3 flange thickness is 3.2 mm (0.126 in).
- The number 4 flange thickness is 3.3 mm (0.130 in).
- The number 5 flange thickness is 3.4 mm (0.134 in).
- The number 6 flange thickness is 3.5 mm (0.138 in).
- The number 7 flange thickness is 3.6 mm (0.142 in).
- The number 8 flange thickness is 3.7 mm (0.146 in).
- The number 9 flange thickness is 3.8 mm (0.150 in).

CASE COVER ASSEMBLY DISASSEMBLE

Special Tools

DT-50899 Spring Compressor

For equivalent regional tools, refer to **Special Tools**.

TRANSMISSION GENERAL DESCRIPTION

The 80-40LE Gen-II is a compact, lightweight, electronically controlled 4-speed automatic transmission that employs a ravigneaux-type planetary gear. Based on a conventional highly efficient 4-speed automatic transmission, the gear train has been simplified to realize further enhanced efficiency.

Based on a conventional 4-speed automatic transmission, pressure control solenoids (SLC1, SLC2, SLB1 and SLU) have been adopted in place of the brake (B2) and one-way clutch (F1).

Lock Up and Slip Control

Based on output speed signals, signals from the ECM (engine speed and throttle opening amount) and the

vehicle speed, the lock up control solenoid assembly (SLU) is linearly controlled to perform lock up control smoothly. In addition, the slip rate of the lock-up clutch is detected by monitoring input speed signals, and slip control is performed.

Learning Control

The TCM performs gear shift control learning and garage shift control learning to provide smooth engagement when performing a garage shift as well as smooth engagement when shifting while driving.

Neutral Control

By disengaging the lock-up clutch when the vehicle is stationary and the shift lever is in the drive (D) position, the transmission effectively changes to neutral, reducing torque converter drag losses. This reduces engine load and vibration at idle and enhances fuel economy.

TRANSMISSION COMPONENT AND SYSTEM DESCRIPTION

Control Functions of the TCM

Automatic Gear Shift Control

Based on each gear shift pattern, shift solenoid (S1) turns ON or OFF and pressure control solenoids (SLC1, SLC2 and SLB1) are operated linearly according to information that includes the vehicle speed, the accelerator position, and brake signals.

Gear and Solenoid Operation

Gear	SLC1	SLC2	SLB1	S1
1st	A (B)	ON	OFF	C
1st Engine Brake	A (B)	A	OFF	ON
2nd	A (B)	ON	A	C
3rd	A	A (B)	OFF	OFF
4th	ON	A (B)	A	OFF
A: Controlled (Neutral Control), B: Controlled (Line Pressure), C: ON: (V < or ==14 km/h (8 mph)) / OFF: (V >14 km/h (8 mph))				

Driver Adaptive Mode Control

The 80-40LE GEN II is always in adaptive mode. It does not have a switch to allow the driver to select a driving mode.

When certain conditions are met, the TCM selects a suitable shift mode for the driving condition, and switches the modes automatically to provide the smooth gear shifts.

Mode	Description
Upslope	When driven on an uphill, the TCM determines the uphill driving based on information such as the signals from the ECM and output speed sensor, and

	switches the driving mode to upslope mode. This prevents the drive force from dropping.
Altitude	At the high ground to which the engine power falls, in order to secure the driving force, a shift point and a lock-up point are changed based on the atmospheric pressure signal transmitted from the ECM.
Cruise Mode	In order to prevent the busy shift under cruise run, based on the cruise signal transmitted from the ECM, a shift point and a lock-up point are changed.
Cruise Uphill Mode	It is the control for driving force reservation on the uphill in cruise control. A shift point is changed when the uphill is detected in the cruise mode.

Lock Up Control and Slip Control

Based on the output speed signals, signals from the ECM (engine speed and throttle opening amount) and the vehicle speed, the lock up control solenoid (SLU) is linearly controlled to perform the lock up control smoothly. In addition, the slip rate of the lock-up clutch is detected by monitoring input speed signals, and slip control is performed.

By allowing the lock-up clutch to slip when lock-up is OFF, slip control extends the lock-up range into lower vehicle speeds. This suppresses a rise in the engine speed and increases transmission efficiency, improving fuel economy. At the same time, through the slipping of the lock-up clutch, engine speed fluctuations can be absorbed by the torque converter.

Control	Description
Lock-Up Control	This control is performed using a lock-up control solenoid (SLU). The lock-up control solenoid (SLU) is linearly turned ON and OFF, the lock-up clutch inside the torque converter is operated, and the pump impeller and turbine runner are connected. This enables the coupling of the engine and the automatic transmission. The engine output is transmitted directly to the automatic transmission, eliminating transmission losses and enhancing fuel economy.
Slip Control	This control is performed using the lock-up control solenoid (SLU). The lock-up control solenoid (SLU) is linearly turned ON and OFF and the lock-up clutch inside the torque converter is operated outside of the lock-up range. The lock-up clutch slips without being completely engaged, increasing transmission efficiency and enhancing fuel economy. However, as the lock-up clutch is slipping, the specified ATF must be used in order for lock-up control to operate correctly.

Neutral Control

By disengaging the lock-up clutch when the vehicle is stationary and the shift lever is in the drive (D) position, the transmission effectively changes to neutral, reducing torque converter drag losses. This reduces engine load and vibration at idle and enhances fuel economy. If the brake pedal is then released, normal creep force will be generated, enabling smooth starting OFF.

- The C1 clutch is controlled separately by the linear solenoid during neutral control.

- If the vehicle is stopped on an uphill creep force is not generated because the transmission is in neutral when neutral control is active. As such, the B1 solenoid operates to keep the vehicle in the same position so that the vehicle can safely start off even on uphills. This is referred to as hill-hold.
- Neutral control is only available when the engine is warm.
- When driven on a steep hill, neutral control is not available.

Garage Shift Control

After the engine is started, when the shift lever is moved from the neutral (N) position to the drive (D) position or from the neutral (N) position to the reverse (R) position, the pressure control solenoids (SLC1 and SLC2) supply the optimal amount of hydraulic pressure to the C1 and C3 clutches, realizing smooth engagement without shift shock.

- When the engine is cold, the stroke resistance of the C1 clutch piston during the first shift operation increases, this in turn creates a lag in shift operation. In order to reduce the amount of lag, control is not performed.
- By controlling the hydraulic pressure according to the piston stroke, smooth engagement without shock is possible.

Reverse Control

If the shift lever is moved from the neutral (N) position to the reverse (R) position while the vehicle is traveling and the transmission shifts into reverse, the wheels may lock up, which is extremely dangerous. In order to avoid this, the TCM prohibits the transmission from shifting into reverse while traveling.

- Even when the shift lever is moved from the neutral (N) position to the reverse (R) position, the transmission does not shift into reverse if the vehicle speed is 7 km/h (4 mph) or more.
- When this control is activated, the B3 brake is released so that the transmission does not shift into reverse.
- Reverse control takes precedence over shift control between the neutral (N) and reverse (R) ranges.

Hydraulic Components

Hydraulic pressure is generated at the oil pump, and the valve body supplies the hydraulic pressure by switching the fluid passages. Based on the control signal from the TCM, the solenoid valves are activated to control the hydraulic pressure to the clutches and brakes, performing gear shifting and lock-up control. In addition, the appropriate amount of fluid is supplied to the torque converter, planetary gears and lubricating parts.

ELECTRONIC COMPONENT DESCRIPTION

Park/Neutral Position (PNP) Switch

Fig. 344: Selector Lever Shaft With Neutral Basic Line
Courtesy of GENERAL MOTORS COMPANY

The park/neutral position (PNP) switch uses the combination of the circuit terminals to transmit information to the TCM about which range the automatic transmission is in.

The engine is only allowed to start with the shift lever in the park (P) or neutral (N) position. The signals are used for the gear shift control.

Automatic Transmission Wiring Harness

Fig. 345: A/T Wiring Harness And TFT Sensor
Courtesy of GENERAL MOTORS COMPANY

The A/T wiring harness (1) is installed on the transmission case and connects to the transmission fluid temperature (TFT) sensor and each solenoid.

The TFT sensor (2), which is integrated into the A/T wiring harness, is installed on the valve body. It directly detects the oil temperature within the hydraulic pressure control circuit and, based on that temperature, it transmits a signal to the TCM. In response to changes in oil temperature, the TCM controls the gear shifting for the smooth shifting across a wide range of temperatures.

Shift Solenoid Valve

Fig. 346: Shift Solenoid Valve

Courtesy of GENERAL MOTORS COMPANY

The shift solenoid (S1) valve (1) is installed on the valve body, and turns ON and OFF based on signals received from the TCM. According to the ON or OFF status of the S1 solenoid valve, the oil passages are switched to realize fuel efficiency. As a fail-safe function, if a S1 solenoid valve abnormality occurs, the TCM will shut off current to the solenoid.

Pressure Control Solenoid Valve (SLC1, SLC2 and SLB1)

Fig. 347: Pressure Control Solenoid Valve (SLC1, SLC2 And SLB1)
Courtesy of GENERAL MOTORS COMPANY

The pressure control solenoids (SLC1(1), SLC2(2) and SLB1(3)) are installed on the valve body, and linearly control hydraulic pressure based on the signals output from the TCM. In this way, hydraulic pressure to the clutches (C1, C2, and C3) and brakes (B1 and B3) is controlled, realizing smooth gear shifts.

Each solenoid performs the gear shifting between 1st and 4th gears and at the same time performs the line pressure control.

As a fail-safe function, if a solenoid abnormality occurs, the TCM will shut off the current to the relevant line pressure control solenoids.

Lock-up Control Solenoid Valve (SLU)

Fig. 348: Lock-up Control Solenoid Valve (SLU)
Courtesy of GENERAL MOTORS COMPANY

The lock-up control solenoid (SLU) (1) is installed on the valve body. Based on the engine speed signal, throttle opening amount signal, input speed sensor signal and output speed sensor signal, the TCM applies current to the lock-up control solenoid (SLU) to linearly control lock-up clutch hydraulic pressure. In this way, lock up control and slip control is performed. As a fail-safe function, if a lock-up control solenoid (SLU) abnormality occurs, then the TCM will shut off the current to the solenoid.

Input and Output Speed Sensor

Fig. 349: Input Speed Sensor And Output Speed Sensor
 Courtesy of GENERAL MOTORS COMPANY

The speed sensors are installed in the transmission case. The input speed sensor (1) detects the revolution speed of the intermediate shaft C2 drum (2) as the input shaft speed. The output speed sensor (3) detects the revolution speed of the counter drive gear (4) as the output shaft speed. These signals are transmitted to the TCM.

Based on those signals, the TCM controls engine torque, shift timing, and lock-up.

DIAGNOSTIC INFORMATION AND PROCEDURES

TRANSMISSION FLUID LEVEL AND CONDITION CHECK

CAUTION: Use correct transmission fluid only. Failure to use the proper fluid may result in transmission internal damage.

1. The vehicle must be on a flat surface.
2. Move the selector lever into park (P) position and then completely engage the parking brake.
3. Start the engine.
4. Wait until transmission temperature reaches 50°C (122°F).

NOTE: The CVT fluid is largely affected by temperature, therefore be sure to use the diagnostic tool to check the fluid temperature while adjusting.

5. Move through the selector lever positions with the foot brake depressed. Switch the selector lever from position P to L and back to P. Hold each position for at least 5 seconds.
6. Check that there is no transmission fluid leakage.

Fig. 5: Drain Plug

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Perform this work with the engine idling.
- Do not re-use drain plug gasket, replace with a NEW gasket.

7. Check the transmission fluid temperature with the diagnostic tool.
 1. If the transmission fluid temperature has reached about 50-80°C (122-176°F), raise the vehicle.
 2. Remove the drain plug (1). Remove and DISCARD the drain plug gasket (2).
 3. If the fluid is flowing as a steady stream, wait until the fluid begins to drip. If no fluid comes out, add the fluid until it drips out.
 4. If the fluid drips out from overflow tube, install the drain plug (1) with a NEW gasket (2) and tighten to 34 (25 lb ft).
8. Lower the vehicle.
9. Stop the engine.

LINE PRESSURE CHECK

1. Check the engine oil level. Refill if necessary.
2. With the engine warmed up, drive the vehicle.

NOTE: When ambient temperature is 20°C (68°F), it takes about 10 minutes for the CVT fluid to warm up to 50-80°C (122-176°F).

3. Check the CVT fluid level and condition. Refill if necessary. Refer to **Transmission Fluid Level and Condition Check**.
4. Block the front and rear wheels and apply the parking brake fully.
5. Start the engine.
6. Set the scan tool.
7. Select "Line Pressure" in data menu.

NOTE: Keep the brake pedal pressed all the way down during the measurement.

8. Measure the line pressure at both idle and stall speed.

Line Pressure Test Result

Engine Operation	P and N Range	R and D Range
Idling	500 kPa (72.5 psi)	500 kPa (72.5 psi)
Stall	-	4500-5000 kPa (652.7-725.2 psi): 1.2 Engine 4280-4780 kPa (620.8-693.3 psi): 1.0 Engine

Line Pressure Test Diagnosis

Result	Possible Cause	
Idle Speed	Low for all positions (P, R, N, D)	Possible causes include malfunctions in the pressure supply system and low oil pump output: • Oil pump wear • Damage of chain and sprocket • Pressure regulator valve or plug stuck or spring fatigue • Pressure regulator valve passage oil leak • Engine idle speed too low
	Only low for a specific position	Possible causes include an oil pressure leak in a passage or device related to the position after the pressure is distributed by the manual valve.
	High	Possible causes include a sensor malfunction or malfunction in the line pressure adjustment function: • Accelerator pedal position signal malfunction • CVT fluid temperature sensor malfunction • Line pressure solenoid malfunction (stuck in OFF state, open circuit, short circuit)

		• Pressure regulator valve stuck
Stall Speed	Line pressure does not rise higher than the line pressure for idle	Possible causes include a sensor malfunction or malfunction in the pressure adjustment function: • TCM malfunction • Line pressure solenoid malfunction (short circuit, stuck in ON state) • Pressure regulator valve stuck
	The pressure rises, but does not enter the standard position	Possible causes include malfunctions in the pressure supply system and malfunction in the pressure adjustment function: • Oil pump wear • Line pressure solenoid malfunction (stuck) • Pressure regulator valve stuck
	Only low for a specific position	Possible causes include an oil pressure leak in a passage or device related to the position after the pressure is distributed by the manual valve.

STALL SPEED TEST

1. Check the engine oil level. Refill if necessary.
2. With the engine warmed up, drive the vehicle.

NOTE: When ambient temperature is 20°C (68°F), it takes about 10 minutes for the CVT fluid to warm up to 50-80°C (122-176°F).

3. Check the CVT fluid level and condition. Refill if necessary. Refer to Transmission Fluid Level and Condition Check.
4. Block the front and rear wheels and apply the parking brake fully.
5. Start the engine.
6. Depress the brake pedal and shift the selector lever to the D position.
7. While depressing the brake pedal, depress the accelerator pedal gradually.
8. Read the stall speed quickly. Then, release your foot from the accelerator pedal quickly.

NOTE: Never depress the accelerator pedal for 5 seconds or more during the test.

9. Shift the selector lever to the N position.
10. Cool the CVT fluid.

NOTE: Run the engine with the idle speed for at least 1 minute.

11. Shift the selector lever to the R position and perform Steps 7-10.

Stall Speed (RPM)

- 2, 270-2, 730 (for 1.2 engine)
- 2, 080-2, 620 (for 1.0 engine)

Result	Probable Cause
Higher than the specified value in "D" or within the specified value in "R"	Low Brake
Within the specified value in "D" or higher than the specified value in "R"	Reverse Brake
Lower than the specified value in "D" and "R"	Engine
Higher than the specified value in "D" and "R"	• Low line pressure • Primary Pulley • Secondary Pulley • Steel Belt

FLUID LEAK DIAGNOSIS

General Method

1. Verify that the leak is transmission fluid.
2. Thoroughly clean the suspected leak area.
3. Operate the vehicle until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut OFF the engine.
6. Look for fluid spots on the paper.
7. Make the necessary repairs.

Powder Method

1. Thoroughly clean the suspected leak area with solvent.
2. Apply an aerosol type leak tracing powder to the suspected leak area.
3. Operate the vehicle until normal operating temperatures are reached.
4. Shut OFF the engine.
5. Inspect the suspected leak area.
6. Trace the leak path through the powder in order to find the source of the leak.
7. Make the necessary repairs.

DTC P0603: CONTROL MODULE LONG TERM MEMORY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0603

Control Module Long Term Memory Reset

Circuit/System Description

This is an internal fault detection of the transmission control module. This fault is handled inside the transmission control module. No external circuits are involved.

Conditions for Running the DTC

- Ignition ON.

- System voltage 10.0-16.0 V.
- DTC P0603 is run during transmission control module power up.

Conditions for Setting the DTC

- The long-term memory reset for the transmission control module has failed a non-volatile flash ROM memory checksum.
- At each ignition ON, the transmission control module compares the calculated value stored in the flash ROM with the value stored in the transmission control module. If the calculated value does not agree with the stored value a checksum error is logged and DTC C0603 is set.

Action Taken When the DTC Sets

P0603 is a Type A DTC.

Conditions for Clearing the DTC

P0603 is a Type A DTC.

Diagnostic Aids

Low voltage or a momentary loss of power or ground to the transmission control module may cause this DTC to set. Verify the following:

- The battery cables are clean and tight and the battery is fully charged. Refer to **Battery Inspection/Test** .
- The transmission control module ground circuits do not have an open or high resistance.
- The transmission control module power circuits do not have an open, short to ground or high resistance.

Circuit/System Verification

1. Ignition OFF for at least one minute to allow for the complete shutdown of the K71 Transmission Control Module. Ignition ON.
2. Verify that DTC P0885 is not set.
 - **If P0885 is set**

Refer to **DTC P0885**.

- **If P0885 is not set**

NOTE: **After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.**

3. Visually inspect each connector terminal of the K71 Transmission Control Module connector for damage or corrosion. Repair as necessary.
4. Clear DTC P0603.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If the DTC sets**

Replace the K71 Transmission Control Module. Refer to **Control Module References** .

- **If the DTC does not set**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K71 Transmission Control Module replacement, setup and programming.

DTC P0705, P0706 OR P0851: TRANSMISSION RANGE SWITCH/PARK/NEUTRAL POSITION SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

HIGH = Ignition voltage LOW = 0 volts				

Circuit/System Description

DTC P0705 or P0706

The transmission range switch is a sliding contact switch which is part of the B81 Park/Neutral Position Switch assembly and is externally mounted on the transmission manual shaft. The transmission range switch is a multi-signal switch. The Ignition Main Relay in the Fuse Block - Underhood supplies ignition voltage to the transmission range switch on a Run/Crank Ignition 1 circuit. The transmission control module provides individual grounds for each of the transmission range position circuits. Each transmission shift lever position grounds one of the switch circuits. In order to determine the gear range selected by the driver, the transmission control module compares the voltage combinations on the signal circuits to a transmission range switch combination look up table stored in the TCM memory. Refer to Transmission Range Switch Logic below.

DTC P0851

The park/neutral position switch is an ON/OFF switch which is part of the B81 Park/Neutral Position Switch assembly and is externally mounted on the transmission manual shaft. The Engine Control Module supplies ignition voltage to the park/neutral position switch on the Park Neutral Position Switch Park Signal circuit. When in Park or Neutral the B81 Park/Neutral Position Switch assembly provides a chassis ground for the circuit. This indicates to the engine control module that the transmission is in an acceptable gear to allow engine start up.

Conditions for Running the DTC

P0705

System voltage 10-16 V.

P0706

System voltage 10-16 V.

P0851

- System voltage 10-16 V.
- Selector lever position P or N.
- Vehicle speed greater than 10 km/h (6 mph).
- Engine Torque greater than 60 N.m (44 lb ft).

- Accelerator pedal position greater than 10%.
- Torque Converter Clutch Slip Speed between -20 RPM and +20 RPM.
- This DTCs runs continuously within the enabling conditions.

Conditions for Setting the DTC

P0705

The transmission control module detects an invalid combination of transmission range signals for more than 30 s.

or

The transmission range switch indicates more than one transmission range for more than 2 s - multiple signals.

P0706

The transmission control module detects engine start-up in a drive range for more than 2 s.

or

The transmission control module detects output shaft speed when the transmission range switch indicates Park.

P0851

The engine control module detects vehicle speed when the park/neutral position switch indicates Park or Neutral for more than 2 s.

Action Taken When the DTC Sets

- DTC P0705 and P0706 are Type B DTCs.
- DTC P0851 is a Type C DTC.
- Auxiliary gear-box is held in 2nd gear.
- Lock-up prohibited.
- Pulley ratio limited to 0.55.

Conditions for Clearing the DTC

- DTC P0705 and P0706 are Type B DTCs.
- DTC P0851 is a Type C DTC.

Diagnostic Aids

By disconnecting the transmission range switch, all ground paths of the TR switch circuits would be removed and the TCM would recognize all circuits as open. The scan tool will display High for all range signals.

Circuit/System Verification

1. Ignition ON. Engine OFF. Transmission in Park.
2. Verify the scan tool Park/Neutral Position Switch parameter displays Park/Neutral.
 - **If the parameter does NOT display Park/Neutral**

Refer to Circuit/System Testing.
 - **If the parameter does display Park/Neutral**
3. Using the S3 Transmission Shift Lever, shift the transmission to Drive.
4. Verify the scan tool Park/Neutral Position Switch parameter displays In-Gear.
 - **If the parameter does NOT display In-Gear**

Refer to Circuit/System Testing.

- **If the parameter does display In-Gear**

5. Verify that the scan tool Transmission Range Switch A/B/C/P parameter displays as described below in the Transmission Range Switch Logic table while moving the S3 Transmission Shift Lever through each position.

- **If the Transmission Range Switch A/B/C/P parameter does NOT display as described**

Refer to Circuit/System Testing.

- **If the Transmission Range Switch A/B/C/P parameter displays as described**

6. Verify that the scan tool Transmission Range Switch parameter matches each position S3 Transmission Shift Lever.

- **If the Transmission Range Switch parameter does NOT match each position of the S3 Transmission Shift Lever**

Refer to Circuit/System Testing.

- **If the Transmission Range Switch parameter does match each position of the S3 Transmission Shift Lever**

7. Verify DTC P0705, P0706 or P0851 is only set as a history DTC.

- **If any of the DTCs are set as current**

Refer to Circuit/System Testing.

- **If any of the DTCs are only set as history**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

8. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the B81 Park/Neutral Position Switch assembly connector for damage or corrosion. Repair as necessary.
9. Clear DTC P0705, P0706 or P0851 from history.
10. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs are set**

11. All OK.

Transmission Range Switch Logic

Gear Selector Position	Signal A	Signal B	Signal C	Signal P

Park (P)	HIGH	HIGH	HIGH	LOW
Reverse (R)	HIGH	HIGH	LOW	HIGH
Neutral (N)	HIGH	LOW	HIGH	HIGH
Drive (D)	LOW	HIGH	HIGH	HIGH
LOW (L)	HIGH	HIGH	HIGH	HIGH
HIGH = Ignition voltage LOW = 0 volts				

Circuit/System Testing

1. Ignition OFF, disconnect the B81 Park/Neutral Position Switch connector.

NOTE:

- When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J 35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.
- Testing for steps 3-6 is performed on the B81 Park/Neutral Position Switch harness connector using the J 35616-2A GY probe.
- Chassis ground to Battery ground 25-35 ohms.

2. Ignition ON, engine OFF.
3. Using a fused jumper wire, test for B+ between the B+ terminal of the battery and the ground circuit of the B81 Park/Neutral Position Switch harness connector terminal 1.

- If less than B+

Repair the open/high resistance in the circuit.

- If B+

4. Using a fused jumper wire, test for B+ between the Park/Neutral Position Switch Park Signal circuit, terminal 4 and chassis ground.

- If less than B+

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Test for less than 10 ohms in the signal circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms
3. Test for infinite resistance between the signal circuit and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
4. Test for infinite resistance between the signal circuit and all other terminals of the B81 Park/Neutral Position Switch harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K20 Engine Control Module. Refer to **Engine Control**

Module Replacement .

○ If B+

5. Using a fused jumper wire, test for B+ between the Run/Crank Ignition 1 Voltage circuit terminal 7 and chassis ground.

○ If less than B+

1. Ignition OFF, disconnect the X3 harness connector at the X50A Fuse Block - Underhood.
2. Test for less than 10 ohms in the Ignition 1 circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms
3. Test for infinite resistance between the Ignition 1 circuit and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
4. Test for infinite resistance between the Ignition 1 circuit and all other terminals of the X50A Fuse Block - Underhood harness connector X3.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the Transmission Control Module Relay. Refer to **X50A Fuse Block - Underhood Top View .**

○ If B+

NOTE: The Transmission Control Module provides a low current diagnostic voltage on the following circuits.

6. Test for 0.18-0.25 V between the following circuits and chassis ground.

- Transmission Position Switch Bit 1 Signal circuit, terminal 5
- Transmission Position Switch Bit 2 Signal circuit, terminal 9
- Transmission Position Switch Bit 3 Signal circuit, terminal 2
- Transmission Position Switch Bit 4 Signal circuit, terminal 3
- Transmission Position Switch Parity Bit Signal circuit, terminal 6

○ If less than 0.18 V

1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
2. Test for less than 10 ohms in the affected control circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms
3. Test for infinite resistance between the affected control and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
4. Test for infinite resistance between the affected control circuit and all other terminals of B81 Park/Neutral Position Switch harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.

- If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If greater than the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for infinite resistance between the affected control circuit and all other terminals of B81 Park/Neutral Position Switch harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If within the specified range**
7. Replace the B81 Park/Neutral Position Switch. Refer to **Park/Neutral Position Switch Replacement**.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Transmission Replacement** for transmission replacement.
- Refer to **Park/Neutral Position Switch Replacement**
- Refer to **Park/Neutral Position Switch Adjustment**
- **Control Module References** for K71 Transmission Control Module replacement, setup and programming.

Circuit	Normal Range	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running in PARK, normal operating temperature				
Trans. Fluid Temp.	Varies near coolant temperature	150°C (304°F)	-40°C (-40°F)	-40°C (-40°F)

Circuit/System Description

The transmission fluid sensor is a negative coefficient thermistor mounted to the Control Solenoid Valve Assembly which has no serviceable parts.

The transmission control module supplies a 2.6 V reference signal circuit and a low reference circuit to the transmission fluid sensor. When the transmission fluid is cold, the sensor resistance is high and the transmission control module senses a high signal voltage. As the transmission fluid warms, the sensor resistance lowers and the transmission control module senses lower voltage. The transmission control module uses the transmission fluid sensor reading in order to control the torque converter clutch, line pressure adjustments and temperature compensated shifts.

Conditions for Running the DTC

P0711

- System voltage 10-16 V.
- Transmission fluid temperature at start up between -40 and +10°C (-40 and +50°F).
- Selector lever in D position.
- Engine speed greater than 450 RPM.
- Vehicle speed greater than 10 km/h (6 mph).
- Accelerator pedal position greater than 12.5%.
- No transmission range switch DTC P0705 or P0706.
- This DTCs runs continuously within the enabling conditions.

P0712

- System voltage 10-16 V.

- This DTCs runs continuously within the enabling conditions.

P0713

- System voltage 10-16 V.
- Vehicle speed greater than 10 km/h (6 mph).
- Engine coolant temperature/intake air temperature greater than -40°C (-40°F)
- This DTCs runs continuously within the enabling conditions.

Conditions for Setting the DTC

P0711

- This diagnostic monitors the transmission fluid sensor circuit. The circuit may be functional but not in the normal operating range. This diagnostic indicates stuck, erratic, intermittent or skewed values, resulting in reduced system performance.
- The transmission fluid temperature remains between -40 and +10°C (-40 and +50°F) after 600 s/10 minutes of driving.

P0712

The transmission fluid temperature is 180°C (356°F) or greater for 5 s.

P0713

The transmission fluid temperature is -40°C (-40°F) or less for 5 s.

Action Taken When the DTC Sets

Condition 1

Engine coolant less than -35°C (-31°F) and engine run time from ignition ON less than 900 s (15 minutes).

- Pulley ratio limited to 2.2.
- Sub shift control is prohibited.
- Turbine torque is limited depending on actual secondary pressure.
- Line pressure is controlled to 0.5 MPa.

Condition 2

Engine coolant less than 10°C (50°F) and engine run time from ignition ON less than 1500 s.

- Pulley ratio limited to 1.0-2.2.
- Sub shift control is prohibited.
- Turbine torque is limited depending on actual secondary pressure.

- Line pressure is controlled to 0.5 MPa.

Condition 3

Engine coolant greater than 10°C (50°F) and engine run time from ignition ON greater than 1500 s.

- Vehicle speed greater than 7 km/h (4.5 mph).
- Turbine torque limited to 30.
- Turbine speed limited to less than 1800 RPM.
- Turbine torque is limited depending on actual secondary pressure.
- Line pressure is controlled to 0.5 MPa.

Conditions for Clearing the DTC

DTCs P0711, P0712 and P0713 are Type B DTCs.

Diagnostic Aids

- The DIC, if equipped, will display TRANSMISSION HOT - IDLE ENGINE when the transmission fluid temperature reaches 132°C (270°F).
- Ask the customer about possible overloading.
- During a road test, the transmission fluid temperature should steadily increase to a normal operating temperature and then stabilize.

Special Tools

J-35616 GM-Approved Terminal Test Kit

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

1. Verify that the transmission fluid level is at the proper level by performing the **Transmission Fluid Level and Condition Check**.
2. Verify that DTC P0111, P0112, P0113, P0114, P0117, P0118 or P0119 is not set.
 - **If DTC P0111, P0112, P0113, P0114, P0117, P0118 or P0119 is set**

Diagnose that DTC first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If DTC P0111, P0112, P0113, P0114, P0117, P0118 or P0119 is not set**

NOTE: **During a road test, the transmission fluid temperature should steadily increase to a normal operating temperature and then stabilize.**

3. Verify the Transmission Fluid Temperature parameter increases greater than 2°C (3.5°F) after operating the vehicle at 64 km/h (40 mph) for 10 minutes.
 - **If the temperature does not increase greater than 2°C (3.5°F)**

Refer to Circuit/System Testing.

- **If the temperature does increase greater than 2°C (3.5°F)**

4. Verify that the transmission fluid temperature parameter is at or near the engine coolant temperature parameter.
 - **If the transmission fluid temperature parameter is NOT at or near the engine coolant temperature parameter**

Refer to Circuit/System Testing.

- **If the transmission fluid temperature parameter IS at or near the engine coolant temperature parameter**

5. Verify DTC P0711, P0712 or P0713 is only set as a history DTC.

- **If any of the DTCs are set as current**

Refer to Circuit/System Testing.

- **If any of the DTCs are only set as history**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

6. Visually inspect each connector terminal of the K71 transmission control module and the Q8 Control Solenoid Valve Assembly connectors for damage or corrosion. Repair as necessary.
7. Clear DTC P0711, P0712 or P0713 from history.
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs set**

9. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Q8 Control Solenoid Valve Assembly connector.

NOTE:

- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
- **Testing for steps 2-5 is performed on the Q8 Control Solenoid Valve Assembly harness connector using the GY probe J-35616-2A.**
- **Chassis ground to battery ground 25-35 ohms.**

2. Test for less than 10 ohms between the low reference circuit terminal 18 and chassis ground.
 - **If 10 ohms or greater**
 1. Disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for less than 10 ohms in the low reference circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms, replace the transmission control module.
 - **If less than 10 ohms**

3. Ignition ON, engine OFF.
4. Test for 2.4-2.8 V between the sensor signal circuit terminal 12 and chassis ground.
 - **If less than the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for less than 10 ohms in the Sensor Signal circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
 3. Test for infinite resistance between the Sensor Signal circuit terminal 12 and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance.
 4. Test for infinite resistance between the Sensor Signal circuit terminal 12 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, test the K71 Transmission Control Module. Refer to Component Testing - K71 Transmission Control Module.
 - **If greater than the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for infinite resistance between the Sensor Signal circuit terminal 12 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, test the K71 Transmission Control Module. Refer to Component Testing - K71 Transmission Control Module.
5. Test for 2.4-2.8 V between the Sensor Signal circuit terminal 12 and the low reference circuit terminal 18.
 - **If less than the specified range**
 1. Test for infinite resistance between the low reference circuit terminal 18 and all other terminals of the Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, test the K71 Transmission Control Module. Refer to Component Testing - K71 Transmission Control Module.
 - **If greater than the specified range**
 1. Test for infinite resistance between the low reference circuit terminal 18 and all other terminals of the Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, test the K71 Transmission Control Module. Refer to Component Testing - K71 Transmission Control Module.
 - **If within the specified range**
6. Sensor signal circuit, low reference circuit and K71 Transmission Control Module OK.

Component Testing

B109 Transfer Case Fluid Temperature Sensor

1. Disconnect the Q8 Control Solenoid Valve Assembly harness connector.

NOTE:

- When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.
- Testing for Step 2 is performed on the Q8 Control Solenoid Valve Assembly connector using the GY probe J 35616-3.

2. Measure the resistance between the transmission fluid temperature sensor signal circuit, terminal 12 and the low reference circuit, terminal 18. Refer to **Temperature Versus Resistance (ECT)** for resistance values.

- If the resistance is not within the specified range for the given temperature. Replace the T12 Automatic Transmission Assembly

Refer to **Transmission Replacement**.

- If the resistance IS within the specified range for the given temperature

3. B109 transmission fluid temperature sensor OK.

K71 Transmission Control Module - CVT

NOTE:

Circuit/System Testing must be performed before proceeding to K71 Transmission Control Module testing.

1. Ignition OFF.
2. Disconnect the Q8 Control Solenoid Valve Assembly harness connector.

NOTE:

- When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.
- Testing for steps 3-x is performed on the Q8 Control Solenoid Valve Assembly harness using the GY probe J-35616-2A.

3. Ignition ON engine OFF. Verify the scan tool Transmission Fluid Temperature parameter displays -40°C (-40°F).

- If the Transmission Fluid Temperature parameter does not display -40°C (-40°F). Replace the K71 Transmission Control Module

Refer to **Transmission Control Module Replacement**.

- If the **Transmission Fluid Temperature** parameter does display **-40°C (-40°F)**
- 4. Using a fused jumper harness, short the signal circuit terminal 12, to the low reference circuit terminal 18. Verify the scan tool **Transmission Fluid Temperature** parameter displays **180°C (356°F)**.
 - If the **Transmission Fluid Temperature** parameter does not display **180°C (356°F)**. Replace the **K71 Transmission Control Module**

Refer to **Transmission Control Module Replacement**.

- If the **Transmission Fluid Temperature** parameter does display **180°C (356°F)**
- 5. K71 transmission control module OK.

Temperature Versus Resistance

Temp (°C/°F)	Normal Range ohms	Nominal
20/68	6825-6175	6500
30/86	4750-4300	4520
40/104	3300-3000	3145
50/122	2310-2090	2200
60/140	1700-1540	1615
70/158	1250-1125	1185
80/176	910-825	870

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, setup and programming.
- Refer to **Transmission Replacement** for transmission replacement.

DTC P0717: INPUT SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0717

Input Speed Sensor Circuit No Signal - Primary Pulley Speed Sensor

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition 1 Voltage	P0717	P0717	-	P0717
Sensor Signal	P0717	P0717	-	P0717
Low Reference	-	P0717	-	-

Typical Scan Tool Data

Parameter	Normal Range	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine idling, normal operating temperature				
Ignition Voltage	10-16 V	0 V	0 V	10-16 V
Engine Speed	500-1050 RPM	500-1050 RPM	500-1050 RPM	500-1050 RPM
Primary Pulley Speed	500-1, 000 RPM	35 RPM or 3616 RPM	35 RPM or 3616 RPM	500-1, 000 RPM
Transmission ISS	55-130 RPM (11-13% of Primary Pulley Speed)	0 RPM	0 RPM	55-130 RPM

Circuit/System Description

The Input Speed Sensor, also known as Primary Pulley Speed Sensor, is a three wire hall-effect sensor. The primary pulley speed sensor provides primary pulley speed information to the transmission control module. The primary pulley speed sensor is mounted on the upper left front of the transmission near the B81 Park Neutral Position Switch facing the primary pulley reluctor wheel. As the primary pulley rotates, the toothed rotor wheel passes through the magnetic field of the primary pulley speed sensor and produces an AC voltage. The AC voltage level and the number of pulses increase as the speed of the pulley increases. The transmission control module converts the voltage to primary pulley speed. The transmission control module uses the primary pulley speed to control engine torque, torque converter lock-up and determine pulley ratios. The transmission control module supplies a B+ (+0.0/-2.0 V) sensor signal circuit, an Ignition 1 voltage circuit and a low reference circuit to the primary pulley speed sensor.

Conditions for Running the DTC

Condition 1

- Engine running.
- Ignition voltage 10-16 V.
- Secondary pulley speed greater than or equal to 1000 RPM.

Condition 2

- Engine running.
- Ignition voltage 10-16 V.

- 10 ms ago, primary pulley speed greater than or equal to 1000 RPM.

Conditions for Setting the DTC

Condition 1 (Low Speed)

- Primary pulley speed parameter is less than 150 RPM for 5 s.
- The transmission control module detects a low pulse signal from the primary pulley speed sensor when there is a high pulse signal coming from the secondary pulley speed sensor for 5 s.

Condition 2 (During Driving)

- Primary pulley speed sensor value is 0 RPM for 500 ms.
- The transmission control module detects no pulse signal from the primary pulley speed sensor when there are pulses from the secondary pulley speed sensor for 500 ms.

Action Taken When the DTC Sets

- P0717 is a Type A DTC.
- Pulley ratio limited to 0.55-2.2.
- Lock-up prohibited.
- Engine torque limited to 100.
- If not in 2nd gear, current gear forced to 2nd gear once wheel speed equals 0 km/h (0 mph).

Conditions for Clearing the DTC

P0717 is a Type A DTC.

Diagnostic Aids

DTC P0717 detects a very low primary pulley speed when the secondary pulley speed is greater than a calibrated value.

Special Tools

J-38522 Variable Signal Generator

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

1. Verify fuse F23 is not open, Fuse Block - Underhood.

- **If the fuse is open**

Test the Run/Crank Ignition 1 voltage circuit for a short to ground. Refer to **Testing for Short to Ground**.

- **If the fuse is not open**

2. Ignition ON, engine OFF.
3. Verify P0562 or P0563 is not set.
 - **If the DTC is set**

Refer to DTC P0562 or P0563.

- **If the DTC is not set**

4. Engine running. Transmission in Park. Brake NOT applied.
5. Verify the scan tool Primary Pulley Speed parameter varies with engine RPM and does not drop out.
 - **If the Primary Pulley Speed does not vary with engine speed or drops out**

Refer to Circuit/System Testing.

- **If the Primary Pulley Speed varies with engine speed and does not drop out**
- 6. Verify P0717 is only set as a history DTC.
 - **If the DTC is set as current**

Refer to Circuit/System Testing.

- **If the DTC is set as history**

NOTE: **After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.**

- 7. Visually inspect each connector terminal of the B14C Input Speed Sensor/Primary Pulley Speed Sensor connector and the K71 Transmission Control Module for damage or corrosion. Repair as necessary.
- 8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

- 9. All OK.

Circuit/System Testing

- 1. Verify fuse F23 is not open, Fuse Block - Underhood.
 - **If the fuse is open**

Test the Ignition 1 voltage circuit and all components connected to the Ignition 1 circuit for a short to ground.

- **If the fuse is not open**

- 2. Ignition OFF, disconnect the harness connector at the B14C Input Speed Sensor/Primary Pulley Speed Sensor.

NOTE:

- **Testing for steps 3-6 is performed on the B14C Input Speed Sensor/Primary Pulley Speed Sensor harness connector using the GY probes J-35616-2A.**
- **Chassis ground to battery ground 25-35 ohms.**

- 3. Test for less than 10 ohms between the low reference circuit terminal 1 and chassis ground or test for less than 50 ohms if between the low reference circuit terminal 1 and the battery ground.
 - **If 10 ohms or greater**

Repair the open/high resistance in the circuit

- **If less than 10 ohms**

4. Ignition ON. Engine OFF.
5. Using a fused jumper wire, test for B+ (+0.0/-0.5 V) between the Ignition 1 voltage circuit terminal 3 and the low reference circuit terminal 1.
 - **If less than B+ (+0.0/-0.5 V)**

Repair the open/high resistance in the circuit

- **If B+ (+0.0/-0.5 V)**

6. Test for B+ (+0.0/-2.5 V) between the sensor signal circuit terminal 2 and the low reference terminal 1.
 - **If less than B+ (+0.0/-2.5 V)**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for less than 10 ohms in the sensor signal circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
 3. Test for infinite resistance between the sensor signal circuit, terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 4. Test for infinite resistance between the sensor signal circuit terminal 2 and all other terminals of the B14C Input Speed Sensor/Primary Pulley Speed Sensor harness connector.
 - If less than infinite resistance, repair the short together in the affected circuits.
 - If infinite resistance
 5. Connect the red lead of the **J-38522** variable signal generator to the sensor signal circuit terminal 2. Connect the black lead of the **J-38522** variable signal generator to the low reference circuit terminal 1. Plug the power cord of the **J-38522** variable signal generator into the cigar lighter.
 6. Set the **J-38522** variable signal generator to 12 volts, the Frequency to 300 and the Duty Cycle to 50%.
 7. Ignition ON. Verify the scan tool Primary Pulley Speed parameter is between 540-660 RPM.
 - If not within the specified range, replace the K71 Transmission Control Module.
 - If within the specified range, test the K71 Transmission Control Module for proper operation. Refer to Component Testing - K71 Transmission Control Module.
 - **If B+ (+0.0/-2.5 V)**
7. Replace the B14C Input Speed Sensor/Primary Pulley Speed Sensor.

Component Testing

NOTE: **You must perform the Circuit/System Testing first.**

K71 Transmission Control Module

1. Ignition OFF, disconnect the harness connector at the B14C Input Speed Sensor/Primary Pulley Speed

Sensor.

NOTE: Testing for steps 2-4 is performed on the B14C Input Speed Sensor/Primary Pulley Speed Sensor harness connector using the GY probes J-35616-2A.

2. Connect the red lead of the J-38522 variable signal generator to the sensor signal circuit terminal 2. Connect the black lead of the J-38522 variable signal generator to the low reference circuit terminal 1. Plug the power cord of the J-38522 variable signal generator into the cigar lighter.
3. Set the J-38522 variable signal generator to 12 volts, the Frequency to 30 and the Duty Cycle to 50%.
4. Ignition ON. Verify the scan tool Primary Pulley Speed parameter is between the following specified ranges as you rotate the frequency switch through the various selections.
 - If not within the specified range, replace the K71 Transmission Control Module.
 - If within the specified range.
5. K71 Transmission Control Module OK.

Primary Pulley Parameter

Frequency	Range	Nominal
30	55-65	60
60	105-135	120
120	215-265	240
250	225-275	250
300	540-660	600
600	1080-1320	1200
1000	1800-2200	2000
5000	9000-11000	10000
10000	18000-22000	20000

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, setup and programming.
- Refer to **Primary Input Speed Sensor Replacement** for Primary Pulley Speed Sensor replacement.

DTC P0721: OUTPUT SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0721

Output Speed Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition 1 Voltage	P0721	P0721	-	P0721
Sensor Signal	P0721	P0721	-	P0721
Low Reference	-	P0721	-	-

Typical Scan Tool Data

Parameter	Normal Range	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Vehicle moving, normal operating temperature				
Transmission OSS	20-50 RPM	0 RPM	0 RPM	20-50 RPM
Vehicle Speed	5-10 km/h (3-6 mph)	0 km/h (0 mph)	0 km/h (0 mph)	5-10 km/h (3-6 mph)

Circuit/System Description

The B14A Output Shaft Speed Sensor is a three wire hall-effect sensor. The output shaft speed sensor provides output shaft speed information to the transmission control module. The output shaft speed sensor is mounted on the middle right rear of the transmission above the right output shaft facing the final gear reluctor wheel. As the final gear rotates, the toothed rotor wheel passes through the magnetic field of the output shaft speed sensor and produces an AC voltage. The AC voltage level and the number of pulses increase as the speed of the final gear increases. The transmission control module converts the voltage to output shaft speed. The transmission control module uses the output shaft speed to determine vehicle speed. The transmission control module supplies a B+ (+0.0/-2.0 V) sensor signal circuit, an Ignition 1 voltage circuit and a low reference circuit to the output Shaft speed sensor.

Conditions for Running the DTC

Condition 1

- Engine running.
- Ignition voltage 10-16 V.
- Selector lever in D, L or R position.

Condition 2

- Engine running.

- Ignition voltage 10-16 V.
- Selector lever in D, L or R position.

Conditions for Setting the DTC

Condition 1 (Low Speed)

- The transmission control module detects a low pulse signal from the output shaft speed sensor when there is a high pulse signal coming from the secondary pulley speed sensor for 5 ms.
- Transmission OSS parameter 250 RPM or less.
- Secondary pulley speed parameter is 1500 RPM or greater for 10 s.

Condition 2 (During Driving)

- The transmission control module detects no pulse signal from the output shaft speed sensor when there are pulses from the secondary speed sensor for 500 ms.
- Output shaft speed sensor parameter is 0 RPM for 500 ms.

Action Taken When the DTC Sets

- P0721 is a Type A DTC.
- Pulley ratio limited to 0.55-2.2.
- Lock-up prohibited.
- Engine torque limited to 100.
- If not in 2nd gear, current gear forced to 2nd gear once wheel speed equals 0 km/h (0 mph).

Conditions for Clearing the DIC/DTC

P0721 is a Type A DTC.

Diagnostic Aids

The transmission control module detects no pulse signal from the output shaft speed sensor when there are pulses from the secondary speed sensor.

Circuit/System Verification

1. Verify fuse F23 is not open, Fuse Block - Underhood.
 - **If the fuse is open**

Test the Run/Crank Ignition 1 voltage circuit for a short to ground. Refer to **Testing for Short to Ground** .

- **If the fuse is not open**
2. Ignition ON, engine OFF.
 3. Verify P0562 or P0563 is not set.
 - **If the DTC is set**

Refer to DTC P0562 or P0563.

- **If the DTC is not set**
4. Engine running, Transmission in Park. Brake NOT applied.
 5. Verify while driving at low speed that the scan tool Transmission OSS parameter varies with actual vehicle speed and does not drop out.
 - **If the Transmission OSS does not vary with actual vehicle speed or drops out**

Refer to Circuit/System Testing.

- **If the Transmission OSS does vary with actual vehicle speed and does not drop out**

6. Verify P0721 is only set as a history DTC.

- **If the DTC is set as current**

Refer to Circuit/System Testing.

- **If the DTC is set as history**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

7. Visually inspect each connector terminal of the B14A Output Shaft Speed Sensor connector and the K71 Transmission Control Module for damage or corrosion. Repair as necessary.
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

9. All OK.

Circuit/System Testing

1. Verify fuse F23 is not open, Fuse Block - Underhood.

- **If the fuse is open**

Test the Ignition 1 voltage circuit and all components connected to the Ignition 1 circuit for a short to ground.

- **If the fuse is not open**

2. Ignition OFF, disconnect the harness connector at the B14A Output Shaft Speed Sensor.

NOTE:

- **Testing for steps 3-6 is performed on the B14A Output Shaft Speed Sensor harness connector using the GY probes J-35616-2A.**
- **Chassis ground to battery ground 25-35 ohms.**

3. Test for less than 10 ohms between the low reference circuit terminal 1 and chassis ground or test for less than 50 ohms if between the low reference circuit terminal 1 and the battery ground.

- **If 10 ohms or greater**

Repair the open/high resistance in the circuit

- **If less than 10 ohms**

4. Ignition ON. Engine OFF.
5. Using a fused jumper wire, test for B+ (+0.0/-0.5 V) between the Ignition 1 Voltage circuit terminal 3 and the low reference circuit terminal 1.
 - **If less than B+ (+0.0/-0.5 V)**

Repair the open/high resistance in the circuit

- **If B+ (+0.0/-0.5 V)**

6. Test for B+ (+0.0/-2.5 V) between the sensor signal circuit terminal 2 and the low reference terminal 1.
 - **If less than B+ (+0.0/-2.5 V)**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for less than 10 ohms in the sensor signal circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
 3. Test for infinite resistance between the sensor signal circuit, terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 4. Test for infinite resistance between the sensor signal circuit terminal 2 and all other terminals of the B14A Output Shaft Speed Sensor harness connector.
 - If less than infinite resistance, repair the short together in the affected circuits.
 - If infinite resistance
 5. Connect the red lead of the **J-38522** variable signal generator to the sensor signal circuit terminal 2. Connect the black lead of the **J-38522** variable signal generator to the low reference circuit terminal 1. Plug the power cord of the **J-38522** variable signal generator into the cigar lighter.
 6. Set the **J-38522** variable signal generator to 12 volts, the Frequency to 300 and the Duty Cycle to 50%.
 7. Ignition ON. Verify the scan tool Transmission OSS parameter is between 540-660 RPM.
 - If not within the specified range, replace the K71 Transmission Control Module.
 - If within the specified range, test the K71 Transmission Control Module for proper operation. Refer to Component Testing - K71 Transmission Control Module.
 - **If B+ (+0.0/-2.5 V)**
7. Replace the B14A Output Shaft Speed Sensor.

Component Testing

NOTE: **You must perform the Circuit/System Testing first.**

K71 Transmission Control Module

1. Ignition OFF, disconnect the harness connector at the B14A Output Shaft Speed Sensor.

NOTE: Testing for steps 2-4 is performed on the B14A Output Shaft Speed Sensor harness connector using the GY probes J-35616-2A.

2. Connect the red lead of the J-38522 variable signal generator to the sensor signal circuit terminal 2. Connect the black lead of the J-38522 variable signal generator to the low reference circuit terminal 1. Plug the power cord of the J-38522 variable signal generator into the cigar lighter.
3. Set the J-38522 variable signal generator to 12 volts, the Frequency to 30 and the Duty Cycle to 50%.
4. Ignition ON. Verify the scan tool Transmission OSS parameter is between the following specified ranges as you rotate the frequency switch through the various selections.
 - If not within the specified range, replace the K71 Transmission Control Module.
 - If within the specified range.
5. K71 Transmission Control Module OK.

Transmission OSS Parameter

Frequency	Range	Nominal
30	55-65	60
60	105-135	120
120	215-265	240
250	225-275	250
300	540-660	600
600	1080-1320	1200
1000	1800-2200	2000
5000	9000-11000	10000
10000	18000-22000	20000

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, setup and programming.
- Refer to **Output Speed Sensor Replacement** for Output Shaft Speed Sensor replacement.

DTC P0741: TORQUE CONVERTER CLUTCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0741

Torque Converter Clutch (TCC) System - Stuck Off - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

The torque converter clutch pressure control solenoid valve is part of the control solenoid valve assembly which has no serviceable parts.

The transmission control module (TCM) controls the torque converter clutch (TCC) pressure control solenoid pressure by regulating the current flow through the torque converter clutch pressure control solenoid valve windings. The transmission control module determines the appropriate pressure for a given load by monitoring the throttle position sensor voltage, the engine speed and other inputs. The transmission control module then varies the duty cycle on the high side of the torque converter clutch pressure control solenoid valve to control current flow to the solenoid. The magnetic field produced by the coil moves the solenoid's internal valve which varies pressure to the torque converter clutch control valve.

When vehicle operating conditions are appropriate to apply the torque converter clutch, the transmission control module will increase current flow to the torque converter clutch pressure control solenoid valve. The torque converter clutch pressure control solenoid valve directs fluid pressure to move the torque converter clutch control valve to the apply position and moves the torque converter regulator valve to the regulating position. The torque converter regulator valve controls torque converter clutch apply fluid pressure proportional to torque converter clutch solenoid pressure. When the torque converter clutch is fully applied the engine is coupled directly to the transmission. Torque converter clutch release is accomplished by the transmission control module decreasing current flow to the torque converter clutch pressure control solenoid valve. This results in decreasing the apply pressure which allows the torque converter clutch control valve to move to the release position. The transmission control module calculates torque converter slip speed based on engine speed and transmission input shaft speed.

Conditions for Running the DTC

- TCM DTC P0717 is not set.
- System voltage 10-16 V.
- TCC lock-up commanded.
- TCC Pressure Control Solenoid Valve Pressure Command greater than 0.2 MPa.
- DTC P0741 runs continuously.

Conditions for Setting the DTC

The TCC Slip Speed is greater than $40 \text{ rpm} + (\text{Engine Speed}/1.25)$ for 30 s.

Action Taken When the DTC Sets

P0741 is a Type B DTC.

Conditions for Clearing the DTC/DTC

P0741 is a Type B DTC.

Diagnostic Aids

- DTC P0741 sets due to non-electrical transmission hydraulic/mechanical performance issues.
- If the torque converter clutch pressure control solenoid valve has no electrical faults but the transmission control module detects greater than acceptable pressure or to less than acceptable pressure DTC P0741 is set.

Circuit/System Verification

1. Verify the transmission fluid level and condition are correct. Refer to **Transmission Fluid Level and Condition Check**.
2. Verify DTC P2763 or P2764 is not set.
 - **If DTC P2763 or P2764 is set**

Refer to **DTC P2763 or P2764**.
 - **If DTC P2763 or P2764 is not set**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

3. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.

4. Clear DTC P0741 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.

- **If none of the DTCs set**
6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for control solenoid valve assembly replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.
- Refer to **Transmission Fluid Level and Condition Check**

DTC P0792: INTERMEDIATE SHAFT SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0792

Intermediate Shaft Speed Sensor Circuit Performance - Secondary Pulley Speed Sensor

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition 1 Voltage	P0792	P0792	-	P0792
Sensor Signal	P0792	P0792	-	P0792
Low Reference	-	P0792	-	-

Typical Scan Tool Data

Parameter	Normal Range	Short to Ground	Open/High Resistance	Short to Voltage
-----------	--------------	-----------------	----------------------	------------------

Operating Conditions: Engine idling, normal operating temperature

Ignition Voltage	10-16 V	0 V	0 V	10-16 V
Engine Speed	550-1050 RPM	550-1050 RPM	550-1050 RPM	550-1050 RPM
Primary Pulley Speed	500-1, 000 RPM	35 RPM or 3616 RPM	35 RPM or 3616 RPM	500-1, 000 RPM
Secondary Pulley Speed	200-500 RPM (40-50% of Primary Pulley Speed)	0 RPM	0 RPM	200-500 RPM

Circuit/System Description

The Secondary Pulley Speed Sensor, also known as the Intermediate Shaft Speed Sensor or the B14B Transmission Turbine Speed Sensor, is a three wire hall-effect sensor. The secondary pulley speed sensor provides secondary pulley speed information to the transmission control module. The secondary pulley speed sensor is mounted on the upper left rear of the transmission facing the secondary pulley reluctor wheel. As the secondary pulley rotates, the toothed rotor wheel passes through the magnetic field of the secondary pulley speed sensor and produces an AC voltage. The AC voltage level and the number of pulses increase as the speed of the pulley increases. The transmission control module converts the voltage to secondary pulley speed. The transmission control module uses the secondary pulley speed to control and determine pulley ratios. The transmission control module supplies a B+ (+0.0/-2.0 V) sensor signal circuit, an Ignition 1 voltage circuit and a low reference circuit to the secondary pulley speed sensor.

Conditions for Running the DTC**Condition 1**

- Engine running.
- Ignition voltage 10-16 V.
- Primary pulley speed greater than or equal to 1000 RPM.

Condition 2

- Engine running.
- Ignition voltage 10-16 V.
- 10 ms ago, secondary pulley speed greater than or equal to 1000 RPM.

Conditions for Setting the DTC**Condition 1 (Low Speed)**

- Secondary pulley speed parameter is less than 150 RPM for 5 s.
- The transmission control module detects a low pulse signal from the secondary pulley speed sensor when there is a high pulse signal coming from the primary pulley speed sensor for 5 s.

Condition 2 (During Driving)

- Secondary pulley speed sensor value is 0 RPM for 500 ms.
- The transmission control module detects no pulse signal from the secondary pulley speed sensor when there are pulses from the primary pulley speed sensor for 500 ms.

Action Taken When the DTC Sets

- P0792 is a Type A DTC.
- Pulley ratio limited to 0.55-2.2.
- Lock-up prohibited.
- Engine torque limited to 100.
- If not in 2nd gear, current gear forced to 2nd gear once wheel speed equals 0 km/h (0 mph).

Conditions for Clearing the DIC/DTC

P0792 is a Type A DTC.

Diagnostic Aids

DTC P0792 detects a very low secondary pulley speed when the primary pulley speed is greater than a calibrated value.

Special Tools

J-38522 Variable Signal Generator

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

1. Verify fuse F23 is not open, Fuse Block - Underhood.

- **If the fuse is open**

Test the Run/Crank Ignition 1 voltage circuit for a short to ground. Refer to **Testing for Short to Ground**.

- **If the fuse is not open**

2. Ignition ON, engine OFF.
3. Verify P0562 or P0563 is not set.

- **If the DTC is set**

Refer to DTC P0562 or P0563.

- **If the DTC is not set**

4. Engine running. Transmission in Park. Brake NOT applied.
5. Verify while driving at low speed that the scan tool Secondary Pulley Speed parameter varies with the engine speed and does not drop out. The Secondary Pulley Speed parameter should be 30-60% of the engine speed parameter.

- **If the Secondary Pulley Speed does not vary with Primary Pulley Speed or drops out**

Refer to Circuit/System Testing.

- **If the Secondary Pulley Speed varies with engine speed and does not drop out**

6. Verify P0792 is only set as a history DTC.

- **If the DTC is set as current**

Refer to Circuit/System Testing.

- **If the DTC is set as history**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal.

Ensure each connector and CPA is correctly seated.

7. Visually inspect each connector terminal of the B14B Transmission Turbine Speed Sensor/Secondary Pulley Speed Sensor connector and the K71 Transmission Control Module for damage or corrosion. Repair as necessary.
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

9. All OK.

Circuit/System Testing

1. Verify fuse F23 is not open, Fuse Block - Underhood.

- **If the fuse is open**

Test the Ignition 1 voltage circuit and all components connected to the Ignition 1 circuit for a short to ground.

- **If the fuse is not open**

2. Ignition OFF, disconnect the harness connector at the B14B Transmission Turbine Speed Sensor/Secondary Pulley Speed Sensor.

NOTE:

- **Testing for steps 3-6 is performed on the B14B Transmission Turbine Speed Sensor/Secondary Pulley Speed Sensor harness connector using the GY probes J-35616-2A.**
- **Chassis ground to battery ground 25-35 ohms.**

3. Test for less than 10 ohms between the low reference circuit terminal 1 and chassis ground or test for less than 50 ohms if between the low reference circuit terminal 1 and the battery ground.

- **If 10 ohms or greater**

Repair the open/high resistance in the circuit

- **If less than 10 ohms**

4. Ignition ON. Engine OFF.

5. Using a fused jumper wire, test for B+ (+0.0/-0.5 V) between the Ignition 1 voltage circuit terminal 3 and the low reference circuit terminal 1.

- **If less than B+ (+0.0/-0.5 V)**

Repair the open/high resistance in the circuit

- **If B+ (+0.0/-0.5 V)**
- 6. Tests for B+ (+0.0/-2.5 V) between the sensor signal circuit terminal 2 and the low reference terminal 1.
 - **If less than B+ (+0.0/-2.5 V)**
 - 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 - 2. Test for less than 10 ohms in the sensor signal circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
 - 3. Test for infinite resistance between the sensor signal circuit, terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 - 4. Test for infinite resistance between the sensor signal circuit terminal 2 and all other terminals of the B14B Transmission Turbine Speed Sensor/Secondary Pulley Speed Sensor harness connector.
 - If less than infinite resistance, repair the short together in the affected circuits.
 - If infinite resistance
 - 5. Connect the red lead of the **J-38522** variable signal generator to the sensor signal circuit terminal 2. Connect the black lead of the **J-38522** variable signal generator to the low reference circuit terminal 1. Plug the power cord of the **J-38522** variable signal generator into the cigar lighter.
 - 6. Set the **J-38522** variable signal generator to 12 volts, the Frequency to 300 and the Duty Cycle to 50%.
 - 7. Ignition ON. Verify the scan tool Secondary Pulley Speed parameter is between 540-660 RPM.
 - If not within the specified range, replace the K71 Transmission Control Module.
 - If within the specified range, test the K71 Transmission Control Module for proper operation. Refer to Component Testing - K71 Transmission Control Module.
 - **If B+ (+0.0/-2.5 V)**
- 7. Replace the B14B Transmission Turbine Speed Sensor/Secondary Pulley Speed Sensor.

Component Testing

NOTE: You must perform the Circuit/System Testing first.

K71 Transmission Control Module

1. Ignition OFF, disconnect the harness connector at the B14B Transmission Turbine Speed Sensor/Secondary Pulley Speed Sensor.

NOTE: Testing for steps 2-4 is performed on the B14B Transmission Turbine Speed Sensor/Secondary Pulley Speed Sensor harness connector using the GY probes J-35616-2A.

2. Connect the red lead of the **J-38522** variable signal generator to the sensor signal circuit terminal 2. Connect the black lead of the **J-38522** variable signal generator to the low reference circuit terminal 1. Plug the power cord of the **J-38522** variable signal generator into the cigar lighter.

3. Set the **J-38522** variable signal generator to 12 volts, the Frequency to 30 and the Duty Cycle to 50%.
4. Ignition ON. Verify the scan tool Secondary Pulley Speed parameter is between the following specified ranges as you rotate the frequency switch through the various selections.
 - If not within the specified ranges, replace the K71 Transmission Control Module.
 - If within the specified range.
5. K71 Transmission Control Module OK.

Secondary Pulley Parameter

Frequency	Range	Nominal
30	55-65	60
60	105-135	120
120	215-265	240
250	225-275	250
300	540-660	600
600	1080-1320	1200
1000	1800-2200	2000
5000	9000-11000	10000
10000	18000-22000	20000

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, setup and programming.
- Refer to **Secondary Input Speed Sensor Replacement** for Secondary Speed Sensor replacement.

DTC P0796 OR P0797: PRESSURE CONTROL SOLENOID VALVE 3

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0796

Pressure Control Solenoid Valve 3 - Stuck Off - Transmission Hydraulic/Mechanical Performance

DTC P0797

Pressure Control Solenoid Valve 3 - Stuck On - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

The pressure control solenoid valve 3 is part of the control solenoid valve assembly.

The transmission control module controls pressure solenoid 3 pressure by regulating the current flow through the pressure control solenoid valve 3 windings. The transmission control module determines the appropriate pressure for a given load by monitoring the throttle position sensor voltage, the engine speed and other inputs. The transmission control module then varies the duty cycle on the high side of the pressure control solenoid valve 3 to control current flow to the solenoid. The magnetic field produced by the coil moves the solenoid's internal valve which varies pressure to the pressure regulator valve. The transmission control module controls the pressure control solenoid valve 3 by applying a varying amount of amperage to the solenoid. Current is controlled from about 20 mA for maximum line pressure to 1200 mA for minimum pressure. The transmission control module monitors the actual current to the solenoid as compared to the requested current.

Conditions for Running the DTC

P0796

- TCM DTC P0705, P0706, P0721, P0792, P0796, P0797, P2714, P2715 or U0100 is not set.
- System voltage 10-16 V.
- Engine Speed greater than 550 rpm.
- Transmission Output Shaft Speed greater than 300 rpm.
- Secondary Pulley Speed greater than 300 rpm.
- Transmission Range D or L.
- Auxiliary gear box in 1st gear.
- Throttle position sensor greater than 7.8%.
- DTC P0796 runs continuously.

P0797

- TCM DTC P0705, P0706, P0721, P0792, P0796, P0797, P2714, P2715 or U0100 is not set.
- System voltage 10-16 V.
- Engine Speed greater than 550 rpm.
- Transmission Output Shaft Speed greater than 300 rpm.
- Secondary Pulley Speed greater than 300 rpm.
- Transmission Range D or L.
- Vehicle Speed greater than 10 km/h (7 mph).
- Auxiliary gear box in 2nd gear.
- Vehicle decelerating for - Condition 1.
- Throttle position sensor greater than 7.8% - Condition 2.
- DTC P0797 runs continuously.

Conditions for Setting the DTC

P0796

The auxiliary gearbox ratio is greater than 2.231 for 2 s.

P0797 - Condition 1

The auxiliary gearbox ratio is greater than 50% of the 1st gear design ratio for 200 ms.

P0797 - Condition 2

The auxiliary gearbox ratio is less than 10% of the 2nd gear design ratio for 500 ms.

Action Taken When the DTC Sets

P0796

- P0796 is a Type B DTC.
- The transmission control module commands the auxiliary gearbox into Neutral until vehicle speed is less than 40 km/h (25 mph). Then the TCM commands the auxiliary gearbox into 2nd gear.

P0797

- P0797 is a Type B DTC.
- The transmission control module commands the auxiliary gearbox into 1st gear.

Conditions for Clearing the DTC

P0796 and P0797 are Type B DTCs.

Diagnostic Aids

- DTC P0796 or P0797 set due to non-electrical transmission hydraulic/mechanical performance issues.
- If the pressure control solenoid valve 3 has no electrical faults but the transmission control module detects greater than acceptable pressure or to less than acceptable pressure DTC P0796 or P0797 is set.

Circuit/System Verification

1. Verify the transmission fluid level and condition are correct. Refer to **Transmission Fluid Level and Condition Check**.
2. Verify DTC P0970 or P0971 is not set.
 - **If DTC P0970 or P0791 is set**

Refer to **DTC P0970 or P0971**.

- **If DTC P0970 or P0791 is not set**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

3. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.
4. Clear DTC P0796 or P0797 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observe from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.

- **If none of the DTCs set**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for control solenoid valve assembly replacement, programming and setup.

- Refer to **Transmission Replacement** for transmission replacement.
- Refer to **Transmission Fluid Level and Condition Check**.

DTC P0841-P0843: TRANSMISSION FLUID PRESSURE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit/Component	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Transmission Auxiliary Oil Pressure Switch Signal	P0842	P0843	P0843	P0841
Transmission Oil Temperature Sensor Low Reference	-	P0713 and/or P0842	-	P0841

Circuit/System Description

The Transmission Fluid Pressure Switch, also known as the Transmission Fluid Pressure Switch 1 or the Secondary Pulley Pressure Sensor, is part of the control solenoid valve assembly which has no serviceable parts.

The Transmission Control Module supplies a signal circuit and a shared ground to the Transmission Fluid Pressure Switch. The Transmission Fluid Pressure Switch shares a ground with the Transmission Fluid Temperature Sensor. When the transmission control module determines that more pressure is needed at the secondary pulley, the transmission control module increases voltage to the transmission fluid pressure switch. When the transmission control module determines that less pressure is needed at the secondary pulley, the transmission control module decreases voltage to the transmission fluid pressure switch.

Conditions for Running the DTC

P0841 - Condition 1

- TCM DTC P0705, P0706, P0717, P0961, P0962, P0963 or U0100 is not set.
- System voltage 10-16 V.
- Transmission Range D.
- Primary Pulley Speed less than 306 rpm.
- Secondary Pulley Speed greater than 230 rpm.
- Vehicle Speed less than 50 km/h (31 mph).
- Rate of change in pulley ratio less than 0.1.
- Calculated throttle position less than 21%.
- DTC P0841 runs continuously.

P0841 - Condition 2

- TCM DTC P0705, P0706, P0717, P0961, P0962, P0963 or U0100 is not set.
- System voltage 10-16 V.
- Engine Speed greater than 450 rpm.
- Transmission Range D.
- Vehicle Speed greater than 10 km/h (6 mph).
- Throttle position sensor greater than 12.5%.
- Transmission Fluid Temperature 20-180°C (68-356°F).
- Target secondary pressure greater than 0 MPa.
- DTC P0841 runs continuously.

P0842

- System voltage 10-16 V.
- Transmission Fluid Temperature greater than -20°C (-4°F).
- DTC P0842 runs continuously.

P0843

- System voltage 10-16 V.
- Transmission Fluid Temperature greater than -20°C (-4°F).
- Target secondary pressure less than 5.7 MPa.
- DTC P0842 runs continuously.

Conditions for Setting the DTC

P0841 - Condition 1

The Secondary Pulley Pressure is greater than 0.675 MPa from what the transmission control module commanded for at least 5 s.

P0841 - Condition 2

The Secondary Pulley Pressure is less than 1.2 MPa from what the transmission control module commanded for at least 30 s.

P0842

Secondary Pulley Pressure Sensor voltage greater than 4.7 V for 5 s or more.

P0843

Secondary Pulley Pressure Sensor voltage less than 0.09 V for 5 s or more.

Action Taken When the DTC Sets

- P0841, P0842 and P0843 are Type B DTCs.
- Secondary pressure feedback control inhibited.

Conditions for Clearing the DTC

P0841, P0842 and P0843 are Type B DTCs.

Diagnostic Aids

A Transmission Fluid Pressure Switch may malfunction due to normal debris in the transmission fluid causing a Transmission Fluid Pressure Switch DTC to intermittently set.

Circuit/System Verification

1. Verify that the scan tool Secondary Pulley Pressure Sensor parameter displays 0.09-4.7 V.
 - **If the Secondary Pulley Pressure Sensor parameter does NOT display 0.09-4.7V**
2. Verify that the scan tool Secondary Pulley Pressure parameter changes as vehicle speed changes.
 - **If the Secondary Pulley Pressure parameter does NOT change as vehicle speed changes**

Refer to Circuit/System Testing.

- **If the Secondary Pulley Pressure Sensor parameter does display 0.09-4.7V**

3. Verify DTC P0841, P0842 or P0843 is only set as a history DTC.
 - **If any of the DTCs are set as current**

Refer to Circuit/System Testing.

- **If any of the DTCs are only set as history**

NOTE: **After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.**

4. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.
5. Clear DTC P0841, P0842 or P0843 from history.
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observe from the Freeze Frame/Failure Records data. The DTC should not set.

- **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs set**

7. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Q8 Control Solenoid Valve Assembly connector.

NOTE:

- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
- **Testing for steps 2-5 is performed on the Q8 Control Solenoid Valve Assembly harness connector using the J-35616-2A GY probe.**
- **Chassis ground to Battery ground 25-35 ohms.**

2. Test for less than 10 ohms between the low reference circuit terminal 18 and chassis ground.

- **If 10 ohms or greater**

1. Disconnect the X2 harness connector at the K71 Transmission Control Module.
2. Test for less than 10 ohms in the low reference circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms, replace the transmission control module.

- **If less than 10 ohms**

3. Engine at Idle. Parking brake engaged. Transmission in Neutral.

4. Test for 0.75-1.00 V between the switch signal circuit terminal 14 and chassis ground.

- **If less than 0.75 V**

1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
2. Test for less than 10 ohms in the switch signal circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms
3. Test for infinite resistance between the switch signal circuit terminal 14 and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
4. Test for infinite resistance between the switch signal circuit terminal 14 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.

- **If greater than 1.00 V**
- 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
- 2. Test for infinite resistance between the switch signal circuit terminal 14 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
- **If between 0.75-1.00 V**
- 5. Test for 0.75-1.00 V between the switch signal circuit terminal 14 and the low reference circuit terminal 18.
 - **If less than 0.75 V**
 - Test for infinite resistance between the low reference circuit terminal 18 and all other terminals of the Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If greater than 1.00 V**
 - Test for infinite resistance between the low reference circuit terminal 18 and all other terminals of the Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If between 0.75-1.00 V**
- 6. Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.

DTC P0863: TRANSMISSION CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0863

Transmission Control Module (TCM) Communication Circuit - (ROM Assembly)

Diagnostic Fault Information

Circuit/Component	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Transmission Manual/Automatic Data Output	P0863	P0863	P0863	-
Transmission Manual/Automatic Data Clock	P0863	P0863	P0863	-
Transmission Manual/Automatic Select Direction	P0863	P0863	P0863	-

Circuit/System Description

At each ignition ON, the transmission control module reads the oil pressure calibration data stored in the CVT ROM assembly.

Conditions for Running the DTC

Condition A - Unable to read oil pressure calibration data

- TCM power supply voltage greater than or equal to 6.5 V.
- Gear selector position: P or N.
- Output speed equals 0.0 km/h/mph.

Condition B - Transmission control module unable to communicate with CVT ROM memory

- TCM power supply voltage 10-16 V.
- Gear selector position: P or N.
- Output speed equals 0.0 km/h/mph.

Conditions for Setting the DTC

At each ignition ON, the transmission control module tries to read the transmission fluid pressure control calibration data stored in the CVT flash ROM assembly. If the transmission control module is unable to read the CVT flash ROM assembly DTC C0863 is set.

Action Taken When the DTC Sets

- P0863 is a Type A DTC.
- Auxiliary gearbox is held in 2nd gear.
- Pulley ratio is fixed at 0.55.
- Lock-up is prohibited.
- Engine torque is limited to 100.

Conditions for Clearing the DTC

P0863 is a Type A DTC.

Diagnostic Aids

Low voltage or a momentary loss of power or ground to the transmission control module may cause this DTC to set. Verify the following:

- The battery cables are clean and tight and the battery is fully charged. Refer to **Battery Inspection/Test** .
- The transmission control module ground circuits do not have an open or high resistance.
- The transmission control module power circuits do not have an open, short to ground or high resistance.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition OFF for at least one minute to allow for the complete shutdown of the K71 Transmission Control Module. Ignition ON.
2. Using a scan tool, erase the CVT calibration data in the TCM.
3. Using a scan tool, run the CVT calibration process.
4. Clear DTC P0863.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**
6. All OK.

Circuit/System Testing

1. Ignition OFF.
2. Disconnect the Q8 Control Solenoid Valve Assembly connector.
3. Test for greater than 1.0 M ohms between each of the following circuits and ground.
 - Transmission Manual/Automatic Data Output circuit, terminal 17
 - Transmission Manual/Automatic Data Clock circuit, terminal 16
 - Transmission Manual/Automatic Select Direction circuit, terminal 15

○ **If 1.0 M ohms or less**

Repair the short to ground in the affected circuit.

○ **If greater than 1.0 M ohms**

4. Test for infinite resistance between each of the following circuits and all other terminals of the Q8 Control Solenoid Valve Assembly connector.
 - Transmission Manual/Automatic Data Output circuit, terminal 17
 - Transmission Manual/Automatic Data Clock circuit, terminal 16
 - Transmission Manual/Automatic Select Direction circuit, terminal 15

○ **If less than infinite resistance**

Repair the short together in the affected circuits.

○ **If infinite resistance**

5. Disconnect the K71 Transmission Control Module X2 harness connector.
6. Test for less than 5 ohms resistance in the following circuits end to end.
 - Transmission Manual/Automatic Data Output circuit, Q8 Control Solenoid Valve Assembly connector terminal 17 to K71 Transmission Control Module harness connector X2 terminal 21
 - Transmission Manual/Automatic Data Clock circuit, Q8 Control Solenoid Valve Assembly connector terminal 16 to K71 Transmission Control Module harness connector X2 terminal 13
 - Transmission Manual/Automatic Select Direction circuit, Q8 Control Solenoid Valve Assembly connector terminal 15 to K71 Transmission Control Module harness connector X2 terminal 22
 - **If 5 ohms or greater**

Repair the open/high resistance in the affected circuit.
 - **If less than 5 ohms**
7. Connect the Q8 Control Solenoid Valve Assembly connector and the K71 Transmission Control Module X2 harness connector.
8. Ignition ON.
9. Using a scan tool, erase the CVT calibration data in the TCM.
10. Using a scan tool, run the CVT calibration process.
11. Clear DTC P0863.
12. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If the DTC sets**

Replace the T12 Automatic Transmission Assembly (CVT). Refer to **Transmission Replacement**.
 - **If the DTC does not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Transmission Replacement** for Automatic Transmission Assembly Replacement.
- Refer to **Control Module References** for Transmission Control Module Programming and Setup.

DTC P0871: TRANSMISSION FLUID PRESSURE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

Typical Scan Tool Data

Transmission Fluid Pressure Switch 3

Circuits	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON. Transmission in Park.			
Transmission Fluid Pressure Switch 3	LOW	HIGH	HIGH

Circuit/System Description

The Transmission Fluid Pressure Switch 3 also known as the Oil Pressure Switch is part of the control solenoid valve assembly which has no serviceable parts.

The Transmission Fluid Pressure Switch 3 shares the Transmission Manual/Automatic Date Output circuit with the ROM Assembly in the transmission. The ROM Assembly uses the Transmission Manual/Automatic Date Output circuit as a low speed serial data circuit between the ROM Assembly in the transmission and the transmission control module. The ROM Assembly only communicates with the transmission control module when the RUN/CRANK circuit goes high. Data is transmitted once during the drive cycle and happens quickly. After that data exchange, the function of the Transmission Manual/Automatic Date Output circuit becomes the Transmission Fluid Pressure Switch 3. The Transmission Fluid Pressure Switch 3 reflects the status of the high clutch oil pressure. The Transmission Fluid Pressure Switch 3 is normally open. When the clutch is commanded ON the Transmission Fluid Pressure Switch 3 closes. The DTC sets if there is a mismatch between the TCM commanded high clutch position and the status of the switch.

Conditions for Running the DTC

Condition 1

- TCM DTC P0705, P0706, P0796, P0797, P0961, P0962, P0963, P2714 or P2715 is not set.
- System voltage 10-16 V.
- Transmission Range P, N or R.
- High clutch pressure command 0 MPa.
- ROM assembly not communicating.
- DTC P0871 runs continuously.

Condition 2

- TCM DTC P0705, P0706, P0796, P0797, P0961, P0962, P0963, P2714 or P2715 is not set.
- System voltage 10-16 V.
- Transmission Range D or L.
- High clutch pressure command 0 MPa.
- Engine Speed greater than 400 RPM.
- Vehicle Speed less than 10 km/h (7 mph).
- Current commanded auxiliary gear 1st gear.
- ROM assembly not communicating.
- DTC P0871 runs continuously.

Condition 3

- TCM DTC P0705, P0706, P0796, P0797, P0961, P0962, P0963, P2714 or P2715 is not set.
- System voltage 10-16 V.
- Transmission Range D or L.
- High clutch pressure command greater than 0.2 MPa.
- Engine Speed greater than 550 RPM.
- Output gear speed greater than 300 RPM.
- Secondary pulley speed greater than 300 RPM.
- Throttle position sensor greater than 7.8%.
- Current commanded auxiliary gear 2nd gear.
- Actual auxiliary gear ratio less than 1.1.
- Vehicle Speed less than 10 km/h (7 mph).
- ROM assembly not communicating.
- DTC P0871 runs continuously.

Conditions for Setting the DTC

Condition 1 and 2

The High Clutch Pressure Switch status displays ON for greater than 1.5 s.

Condition 3

The High Clutch Pressure Switch status displays OFF for greater than 1.5 s.

Action Taken When the DTC Sets

- P0871 is a Type A DTC.
- Auxiliary gearbox held in 2nd gear.

- Neutral idle disabled.

Conditions for Clearing the DTC

P0871 is a Type A DTC.

Diagnostic Aids

CAUTION: Use correct transmission fluid only. Failure to use the proper fluid may result in transmission internal damage.

A Transmission Fluid Pressure Switch may malfunction due to normal debris in the transmission fluid causing a Transmission Fluid Pressure Switch DTC to intermittently set. If DTC P0871 continues to intermittently set, replacing the transmission fluid may correct the problem. Refer to **Transmission Fluid Level and Condition Check** for transmission draining and filling.

Circuit/System Verification

1. Ignition ON. Engine OFF. Transmission in Park.
2. Verify that the Transmission Fluid Pressure Switch 3 scan tool parameter displays HIGH.
 - **If the parameter does NOT display HIGH**

Refer to Circuit/System Testing.

- **If the parameter does display HIGH**
3. Using the S3 Transmission Shift Lever, shift the transmission to Low.
 4. While monitoring the Transmission Fluid Pressure Switch 3 parameter, accelerate the vehicle to 60 km/h (37 mph). Maintain that speed for at least 15 s with the Calculated Throttle Position parameter displaying less than 20%.
 5. Verify that the Transmission Fluid Pressure Switch 3 parameter continues to display High.
 - **If the parameter does NOT display High**

Refer to Circuit/System Testing.

- **If the parameter does display High**
6. Stop the vehicle.
 7. Using the S3 Transmission Shift Lever, shift the transmission to Drive.
 8. While monitoring the Transmission Fluid Pressure Switch 3 parameter, accelerate the vehicle to 60 km/h (37 mph). Maintain that speed for at least 15 s with the Calculated Throttle Position parameter displaying less than 20%.
 9. Verify that the Transmission Fluid Pressure Switch 3 scan tool parameter displays LOW.
 - **If the parameter does NOT display LOW**
- Refer to Circuit/System Testing.
- **If the parameter does display LOW**
10. Verify DTC P0871 is only set as a history DTC.
 - **If the DTC is set as current**
- Refer to Circuit/System Testing.

- **If the DTC is only set as history**

NOTE: **After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.**

11. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.

12. Clear DTC P0871 from history.
13. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

14. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Q8 Control Solenoid Valve Assembly connector and the K71 Transmission Control Module X2 connector.

NOTE:

- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J 35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
- **Testing for steps 2-4 is performed on the Q8 Control Solenoid Valve Assembly harness connector using the GY probe J 35616-2A.**
- **Chassis ground to Battery ground 25-35 ohms.**

2. Test for infinite resistance between the Transmission Manual/Automatic Date Output circuit terminal 21 and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance.
3. Test for infinite resistance between the Transmission Manual/Automatic Date Output circuit terminal 21 and all other terminals of the Q8 Control Solenoid Valve Assembly connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance.
4. Test for less than 10 ohms in the Transmission Manual/Automatic Date Output circuit end to end.
 - **If 10 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 10 ohms**

5. Connect all disconnected connectors.
6. Ignition ON. Engine OFF. Transmission in Park.
7. Verify that the Transmission Fluid Pressure Switch 3 scan tool parameter displays HIGH.
 - **If the parameter does NOT display HIGH**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.

- **If the parameter does display HIGH**

8. Using the S3 Transmission Shift Lever, shift the transmission to Drive.

9. Verify that the Transmission Fluid Pressure Switch 3 scan tool parameter displays LOW.

- **If the parameter does NOT display LOW**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.

- **If the parameter does display LOW**

10. Transmission Manual/Automatic Date Output circuit and ROM Assembly OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for control solenoid valve assembly replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.
- Refer to **Transmission Fluid Level and Condition Check** for transmission draining and filling.

DTC P0885: TRANSMISSION CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0885

Transmission Control Module (TCM) Power Relay Control Circuit

Diagnostic Fault Information

Circuit/Component	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Transmission Main Relay Fused supply 1	P0885	P0885	-	P0885
Transmission Main Relay Fused supply 1	P0885	P0885	-	P0885
Transmission Main Relay Control	P0885	P0885	-	P0885
Ground	-	P0885	-	-

Circuit/System Description

The Transmission Control Module Relay supplies 3 ignition voltage signals to the transmission control module.

Two of the ignition voltage circuits are Transmission Main Relay Fused Supply 1 circuits which are protected by fuse F14UA, X50A Fuse Block - Underhood. The other voltage circuit is the Transmission Main Relay Control circuit which is protected by fuse F2UA, X50A Fuse Block - Underhood.

Conditions for Running the DTC

- Battery voltage greater than 11 V.
- DTC P0885 runs continuously.

Conditions for Setting the DTC

System voltage is less than 8.4 V for 200 ms.

Action Taken When the DTC Sets

- P0885 is a Type A DTC.
- Pulley ratio limited to 0.55.
- Lock-up prohibited.
- Engine torque limited to 100.
- If not in 2nd gear, current gear forced to 2nd gear.

Conditions for Clearing the DTC

P0885 is a Type A DTC.

Diagnostic Aids

An open TCM fuse or a malfunctioning transmission control module relay can cause P0885 to set.

Circuit/System Verification

1. Verify that the Ignition Voltage parameter displays greater than 8.4 V.
 - **If the Ignition Voltage parameter does NOT display greater than 8.4 V**

Refer to Circuit/System Testing.

- **If the Ignition Voltage parameter does display greater than 8.4 V**

2. Verify DTC P0885 is only set as a history DTC.
 - **If DTC P0885 is set as current**

Refer to Circuit/System Testing.

- **If DTC P0885 is only set as history**

NOTE: **After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.**

3. Visually inspect each connector terminal of the K71 transmission control module X1 and X2 connectors for damage or corrosion. Repair as necessary.
4. Clear DTC P0885 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observe from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs set**

Refer to Circuit/System Testing.

- **If none of the DTCs set**

6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the K71 Transmission Control Module X1 connector.

NOTE:

- When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J 35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.
- Testing for step 3-4 is performed on the K71 Transmission Control Module X1 harness connector using the J 35616-64B LT BU probe.
- Chassis ground to Battery ground 25-35 ohms.

2. Ignition ON, engine OFF.
3. Using a fused jumper, test for B+ (+0.0/-1.0 V) between the Transmission Main Relay Control circuit, terminal 16 and chassis ground.
 - If less than B+ (+0.0/-1.0 V)
 1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.
 2. Test for less than 10 ohms in the affected circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms
 3. Test for infinite resistance between the affected circuit and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 4. Test for infinite resistance between the affected circuit and all other terminals of the X50A Fuse Block - Underhood harness connector X1.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the Transmission Control Module Relay.

Refer to **X50A Fuse Block - Underhood Top View** .

- If B = (+0.0/-1.0 V)
4. Using a fused jumper, ground the Transmission Main Relay Control circuit, terminal 16 to chassis ground.

NOTE:

- NOT grounding the Transmission Main Relay Control circuit, terminal 16 to chassis ground will leave the Transmission Main Relay Fused supply 1 circuits, terminal 5 & 6 at 0 V.
- Grounding the Transmission Main Relay Control circuit, terminal 16 to chassis ground will energize the relay and cause the Transmission Main Relay Fused supply 1 circuits, terminal 5 & 6 to go to B+ (+0.0/-1.0 V).

5. Using a fused jumper, test for B+ (+0.0/-1.0 V) between the following circuits and chassis ground.
 - Transmission Main Relay Fused supply 1 circuit, terminal 5

- Transmission Main Relay Fused supply 1 circuit, terminal 6

- **If less than B+ (+0.0/-1.0 V)**

1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
2. Test for less than 10 ohms in the affected circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms
3. Test for infinite resistance between the affected circuit and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
4. Test for infinite resistance between the affected circuit and all other terminals of the X50A Fuse Block - Underhood harness connector X2.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the Transmission Control Module Relay.

Refer to **X50A Fuse Block - Underhood Top View** .

- **If B = (+0.0/-1.0 V)**

6. Ignition OFF, disconnect the K71 Transmission Control Module X2 connector.
7. Ignition ON, engine OFF.
8. Using a fused jumper, test for B+ (+0.0/-1.0 V) between the Transmission Main Relay Control circuit, Transmission Control Module X1 connector terminal 16 and the following circuits.
 - Ground circuit, Transmission Control Module X2 connector terminal 11
 - Ground circuit, Transmission Control Module X2 connector terminal 12
 - **If less than B+ (+0.0/-1.0 V)**
1. Ignition OFF, disconnect the G104 ground connector.

Refer to **G104 and G107** .

2. Test for less than 10 ohms in the affected circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms
3. Test for infinite resistance between the affected circuit and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
4. Test for infinite resistance between the affected circuit and all other terminals of the Transmission Control Module X2 connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module.

- **If B+ (+0.0/-1.0 V)**

9. Transmission Main Relay Fused supply 1 circuits, Transmission Main Relay Control circuit and Ground

circuits OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for transmission control module replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.
- Refer to **X50A Fuse Block - Underhood Top View** for fuse and relay location.

DTC P0961-P0963: LINE PRESSURE CONTROL SOLENOID

Circuit/System Description

The line pressure control solenoid is part of the control solenoid valve assembly which has no serviceable parts.

The transmission control module controls transmission line pressure by regulating the current flow through the pressure control solenoid valve windings. The transmission control module determines the appropriate line pressure for a given load by monitoring the throttle position sensor voltage, the engine speed and other inputs. The transmission control module then varies the duty cycle on the high side of the line pressure control solenoid valve to control current flow to the solenoid. The magnetic field produced by the coil moves the solenoids internal valve which varies pressure to the pressure regulator valve. The transmission control module controls the pressure control solenoid valve by applying a varying amount of amperage to the solenoid. Current is controlled from about 20 mA for maximum line pressure to 1200 mA for minimum line pressure. The transmission control module compares the actual current to the solenoid to the requested current.

Conditions for Running the DTC

P0961

- System voltage 10-16 V.
- Line pressure control solenoid valve output current 750 mA or more.
- DTC P0717 or P0721 not set.
- Engine speed greater than 600 RPM.
- Selector lever position D, L or R.
- Accelerator pedal position greater than 10%.
- Primary pulley speed greater than 500 RPM.
- Transmission OSS parameter less than 108 or secondary pulley speed greater than 61 RPM.
- This DTCs runs continuously within the enabling conditions

P0962

- System voltage 10-16 V.
- Line pressure control solenoid valve output current 750 mA or more.
- This DTCs runs continuously within the enabling conditions.

P0963

- System voltage 10-16 V.

- Line pressure control solenoid valve output current 750 mA or more.
- DTC P0962 not set.
- This DTCs runs continuously within the enabling conditions.

Conditions for Setting the DTC

P0961 - Condition 1

The actual pulley ratio of the primary pulley speed to secondary pulley speed is greater than 2.55 for 200 msec. Condition must happen twice within 1 s.

P0961 - Condition 2

The actual pulley ratio of the primary pulley speed to secondary pulley speed is greater than 3.35 for 100 msec. Condition must happen twice within 1 s.

P0962

- The transmission control module has determined that there is a short to ground in the circuit.
- The line pressure solenoid valve current is 200 mA or less for 200 ms.

P0963

- The transmission control module has determined that there is an open or short to voltage in the circuit.
- The line pressure solenoid valve current is 200 mA or less for 200 ms.

Action Taken When the DTC Sets

- DTC P0961, P0962 and P0963 are Type B DTCs.
- Pulley ratio limited to 0.55.
- Lock-up prohibited.
- Engine torque limited to 100.
- If not in 2nd gear, current gear forced to 2nd gear once wheel speed equals 0 km/h (0 mph).

Conditions for Clearing the DIC/DTC

DTC P0961, P0962 and P0963 are Type B DTCs.

Circuit/System Verification

1. Verify that all of the following scan tool parameters display OK.
 - Line Pressure Control Solenoid Valve Control Circuit Low Voltage Test Status
 - Line Pressure Control Solenoid Valve Control Circuit High Voltage Test Status
 - **If any of the parameters do NOT display OK**

Refer to Circuit/System Testing.

- **If all of the parameters display OK**

2. Verify DTC P0961, P0962 or P0963 is only set as a history DTC.

- **If any of the DTCs are set as current**

Refer to Circuit/System Testing.

- **If any of the DTCs are only set as history**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

3. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.
4. Clear DTC P0961, P0962 or P0963 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs set**
6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Q8 Control Solenoid Valve Assembly connector.

NOTE:

- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
- **Testing for step 3 is performed on the Q8 Control Solenoid Valve Assembly harness connector using the GY probe J-35616-2A.**
- **Chassis ground to battery ground 25-35 ohms.**

2. Ignition ON, engine OFF.
3. Test for 2.4-2.8 V between the control circuit terminal 1 and chassis ground.
 - **If less than the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for less than 10 ohms in the control circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
 3. Test for infinite resistance between the control circuit terminal 1 and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance.
 4. Test for infinite resistance between the control circuit terminal 1 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If greater than the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.

2. Test for infinite resistance between the control circuit terminal 1 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If within the specified range**
4. Sensor signal circuit, low reference circuit and K71 Transmission Control Module OK.

Component Testing

Line Pressure Control Solenoid Valve

1. Disconnect the Q8 Control Solenoid Valve Assembly harness connector.

NOTE:

- When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.
- Testing for Step 2 is performed on the Q8 Control Solenoid Valve Assembly connector using the GY probe J-35616-3.

2. Measure the resistance between the control circuit, terminal 1 and chassis ground. Refer to **Temperature Versus Resistance (ECT)** for resistance values.
 - **If the resistance is not within the specified range for the given temperature**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.
 - **If the resistance IS within the specified range for the given temperature**
3. Line pressure control solenoid OK.

Temperature Versus Resistance

Temp (°C/°F)	Normal Range ohms	Nominal ohms
20/68	5.1-5.5	5.3
30/86	5.3-5.7	5.5
40/104	5.6-6.0	5.8
50/122	5.8-6.2	6.0
60/140	6.0-6.4	6.2
70/158	6.3-6.7	6.5
80/176	6.5-6.9	6.7

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.

DTC P0965-P0967: PRESSURE CONTROL SOLENOID VALVE 2

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

Pressure Control Solenoid Valve 2 Control Circuit High Voltage Test Status	OK	Malfunction	Malfunction	OK

Circuit/System Description

The pressure control solenoid valve 2 is part of the control solenoid valve assembly which has no serviceable parts.

The transmission control module controls pressure solenoid 2 pressure by regulating the current flow through the pressure control solenoid valve 2 windings. The transmission control module determines the appropriate pressure for a given load by monitoring the throttle position sensor voltage, the engine speed and other inputs. The transmission control module then varies the duty cycle on the high side of the pressure control solenoid valve 2 to control current flow to the solenoid. The magnetic field produced by the coil moves the solenoid's internal valve which varies pressure to the pressure regulator valve. The transmission control module controls the pressure control solenoid valve 2 by applying a varying amount of amperage to the solenoid. Current is controlled from about 20 mA for maximum line pressure to 1200 mA for minimum pressure. The transmission control module monitors the actual current to the solenoid as compared to the requested current.

Conditions for Running the DTC

P0965

- System voltage 10-16 V.
- DTC P0717, P0792, P0841, P0842, P0843, P0961, P0962, P0963 or P0965 not set.
- Engine speed greater than 500 RPM.
- Selector lever position D, L or R.
- This DTC runs continuously within the enabling conditions.

P0966

- System voltage 10-16 V.
- Pressure control solenoid valve 2 output current 750 mA or more.
- This DTC runs continuously within the enabling conditions.

P0967

- System voltage 10-16 V.
- Pressure control solenoid valve 2 output current 750 mA or more.
- DTC P0966 not set.
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTC

P0965 - Condition 1

The actual pulley ratio of the primary pulley speed to secondary pulley speed is 2.0-2.4 when the target pulley ratio is less than 1.2 for 5 s.

P0965 - Condition 2

The actual pulley ratio of the primary pulley speed to secondary pulley speed is 0.35-0.75 when the target pulley ratio is greater than 1.55 for 5 s.

P0966

- The transmission control module has determined that there is a short to ground in the circuit.
- The line pressure solenoid valve current is 200 mA or less for 200 ms when 750 mA is commanded.

P0967

- The transmission control module has determined that there is an open or short to voltage in the circuit.
- The line pressure solenoid valve current is 200 mA or less for 200 ms when 750 mA is commanded.

Action Taken When the DTC Sets

- DTC P0965, P0966 and P0967 are Type B DTCs.
- Pulley ratio limited to 0.55.
- Lock-up prohibited.
- Engine torque limited to 100.
- If not in 2nd gear, current gear forced to 2nd gear once wheel speed equals 0 km/h (0 mph).

Conditions for Clearing the DTC

DTC P0965, P0966 and P0967 are Type B DTCs.

Refer to Circuit/System Testing.

- **If any of the DTCs are only set as history**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

3. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.
4. Clear DTC P0965, P0966 or P0967 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs set**

6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Q8 Control Solenoid Valve Assembly connector.

NOTE:

- When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.
- Testing for step 3 is performed on the Q8 Control Solenoid Valve Assembly harness connector using the GY probe J-35616-2A.
- Chassis ground to battery ground 25-35 ohms.

2. Ignition ON, engine OFF.
3. Test for 2.4-2.8 V between the control circuit terminal 2 and chassis ground.
 - If less than the specified range
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for less than 10 ohms in the control circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
 3. Test for infinite resistance between the control circuit terminal 2 and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance.
 4. Test for infinite resistance between the control circuit terminal 2 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to Transmission Control Module Replacement.
 - If greater than the specified range
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for infinite resistance between the control circuit terminal and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to Transmission Control Module Replacement.
 - If within the specified range
4. Sensor signal circuit, low reference circuit and K71 Transmission Control Module OK.

Component Testing

Pressure Control Solenoid Valve 2

1. Disconnect the Q8 Control Solenoid Valve Assembly harness connector.

NOTE:

- When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.
- Testing for Step 2 is performed on the Q8 Control Solenoid Valve Assembly connector using the GY probe J-35616-3.

2. Measure the resistance between the control circuit, terminal 2 and chassis ground. Refer to **Temperature Versus Resistance (ECT)** for resistance values.

- If the resistance is not within the specified range for the given temperature

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.

- If the resistance IS within the specified range for the given temperature

3. Pressure control solenoid valve 2 OK.

Temperature Versus Resistance

Temp (°C/°F)	Normal Range ohms	Nominal ohms
20/68	5.1-5.5	5.3
30/86	5.3-5.7	5.5
40/104	5.6-6.0	5.8
50/122	5.8-6.2	6.0

Circuit/System Description

The pressure control solenoid valve 3 is part of the control solenoid valve assembly which has no serviceable parts.

The transmission control module controls pressure solenoid 3 pressure by regulating the current flow through the pressure control solenoid valve 3 windings. The transmission control module determines the appropriate pressure for a given load by monitoring the throttle position sensor voltage, the engine speed and other inputs. The transmission control module then varies the duty cycle on the high side of the pressure control solenoid valve 3 to control current flow to the solenoid. The magnetic field produced by the coil moves the solenoids internal valve which varies pressure to the pressure regulator valve. The transmission control module controls the pressure control solenoid valve 3 by applying a varying amount of amperage to the solenoid. Current is controlled from about 20 mA for maximum line pressure to 1200 mA for minimum pressure. The transmission control module monitors the actual current to the solenoid as compared to the requested current.

Conditions for Running the DTC

P0970

- System voltage 10-16 V.

- Pressure control solenoid valve 3 output current 750 mA or more.
- This DTCs runs continuously within the enabling conditions.

P0971

- System voltage 10-16 V.
- Pressure control solenoid valve 3 output current 750 mA or more.
- DTC 2720 not set.
- This DTCs runs continuously within the enabling conditions.

Conditions for Setting the DTC

P0970

- The transmission control module has determined that there is a short to ground in the circuit.
- The pressure control solenoid valve 3 current is 200 mA or less for 200 ms when 700 mA is commanded.

P0971

- The transmission control module has determined that there is an open or short to voltage in the circuit.
- The pressure control solenoid valve 3 current is 200 mA or less for 200 ms when 700 mA is commanded.

Action Taken When the DTC Sets

P0970

- P0970 is a Type B DTC.
- If not in 2nd gear, current gear forced to 2nd gear once wheel speed equals 40 km/h (25 mph).
- If in 2nd gear, 2nd held until wheel speed equals 0 km/h (0 mph).

P0971

- P0971 is a Type B DTC.
- When the transmission control module has determined that there is an open in the circuit, if commanding 1st gear the auxiliary gearbox will be in a neutral state until wheel speed equals 40 km/h (25 mph).
- When the transmission control module has determined that there is a short to voltage in the circuit, the auxiliary gearbox is held in 1st gear.

Conditions for Clearing the DTC

DTC P0970 and P0971 are Type B DTCs.

Circuit/System Verification

1. Verify that all of the following scan tool parameters display OK.
 - Pressure Control Solenoid Valve 3 Control Circuit Low Voltage Test Status
 - Pressure Control Solenoid Valve 3 Control Circuit High Voltage Test Status
 - **If any of the parameters do NOT display OK**

Refer to Circuit/System Testing.

- **If all of the parameters display OK**

2. Verify DTC P0970 or P0971 is only set as a history DTC.
 - **If any of the DTCs are set as current**

Refer to Circuit/System Testing.

- **If any of the DTCs are only set as history**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

3. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.
4. Clear DTC P0970 or P0971 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs set**

6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Q8 Control Solenoid Valve Assembly connector.

- NOTE:**
- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
 - **Testing for step 3 is performed on the Q8 Control Solenoid Valve Assembly harness connector using the GY probe J 35616-2A.**
 - **Chassis ground to Battery ground 25-35 ohms.**

2. Ignition ON, engine OFF.
3. Test for 2.4-2.8 V between the control circuit terminal 6 and chassis ground.
 - **If less than the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for less than 10 ohms in the control circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
 3. Test for infinite resistance between the control circuit terminal 6 and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance.
 4. Test for infinite resistance between the control circuit terminal 6 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.

- **If greater than the specified range**

1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
2. Test for infinite resistance between the control circuit terminal 6 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.

- **If within the specified range**

4. Sensor signal circuit, low reference circuit and K71 Transmission Control Module OK.

Component Testing

Pressure Control Solenoid Valve 3

1. Disconnect the Q8 Control Solenoid Valve Assembly harness connector.

NOTE:

- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
- **Testing for Step 2 is performed on the Q8 Control Solenoid Valve Assembly connector using the GY probe J-35616-3.**

2. Measure the resistance between the control circuit, terminal 6 and chassis ground. Refer to **Temperature Versus Resistance (ECT)** for resistance values.

- **If the resistance is not within the specified range for the given temperature**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.

- **If the resistance IS within the specified range for the given temperature**

3. Pressure control solenoid valve 3 OK.

Temperature Versus Resistance

Temp (°C/°F)	Normal Range ohms	Nominal ohms
20/68	5.1-5.5	5.3
30/86	5.3-5.7	5.5
40/104	5.6-6.0	5.8
50/122	5.8-6.2	6.0
60/140	6.0-6.4	6.2
70/158	6.3-6.7	6.5

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.

DTC P1790: TRANSMISSION CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1790

Transmission Control Module Checksum Error - ROM Assembly

Circuit/System Description

At each ignition ON, the transmission control module compares the calibration data stored in the CVT ROM assembly with the calibration data stored in the transmission control module. If the ROM assembly data does not agree with the transmission control module data a checksum error is logged and DTC P1790 is set.

This is an internal fault of the CVT ROM assembly in the transmission detected by the transmission control module. No external circuits are involved.

Conditions for Running the DTC

- Ignition ON.
- Ignition voltage 10.0-16.0 V.
- DTC P1790 is run during transmission control module power up.

Conditions for Setting the DTC

- The read only memory (ROM) assembly on the control solenoid valve assembly has been successfully read by the transmission control module
- Transmission output speed equals 0.0 km/h/mph.
- The ROM checksum test has failed 5 or more times.

Action Taken When the DTC Sets

- P1790 is a Type B DTC.
- Auxiliary gearbox is held in 2nd gear.
- Pulley ratio is fixed at 0.55.
- Lock-up is prohibited.
- Engine torque is limited to 100.

Conditions for Clearing the DTC

P1790 is a Type B DTC.

DTC P2714 OR P2715: PRESSURE CONTROL SOLENOID VALVE 4

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2714

Pressure Control Solenoid Valve 4 - Stuck Off - Transmission Hydraulic/Mechanical Performance

DTC P2715

Pressure Control Solenoid Valve 4 - Stuck On - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

The pressure control solenoid 4 is part of the control solenoid valve assembly, which has no serviceable parts.

The transmission control module controls the control solenoid valve 4 pressure by regulating the current flow through the pressure control solenoid valve 4 windings. The transmission control module determines the appropriate pressure for a given load by monitoring the throttle position sensor voltage, the engine speed and other inputs. The transmission control module then varies the duty cycle on the high side of the pressure control solenoid valve 4 to control current flow to the solenoid. The magnetic field produced by the coil moves the solenoid's internal valve which varies pressure to the pressure regulator valve. The transmission control module

controls the pressure control solenoid valve 4 by applying a varying amount of amperage to the solenoid. Current is controlled from about 20 mA for maximum line pressure to 1200 mA for minimum pressure. The transmission control module monitors the actual current to the solenoid as compared to the requested current.

Conditions for Running the DTC

P2714

- TCM DTC P0705, P0706, P0721, P0792, P0796, P0797, P2714, P2715 or U0100 is not set.
- System voltage 10-16 V.
- Engine Speed greater than 550 rpm.
- Transmission Output Shaft Speed greater than 300 rpm.
- Secondary Pulley Speed greater than 300 rpm.
- Transmission Range D or L.
- Vehicle Speed greater than 10 km/h (7 mph).
- Auxiliary gear box in 1st gear.
- Vehicle decelerating for - Condition 1.
- Throttle position sensor greater than 7.8% - Condition 2.
- DTC P2714 runs continuously.

P2715

- TCM DTC P0705, P0706, P0721, P0792, P0796, P0797, P2714, P2715 or U0100 is not set.
- System voltage 10-16 V.
- Engine Speed greater than 550 rpm.
- Transmission Output Shaft Speed greater than 300 rpm.
- Secondary Pulley Speed greater than 300 rpm.
- Transmission Range D or L.
- Vehicle Speed greater than 10 km/h (7 mph).
- Auxiliary gear box in 2nd gear.
- Throttle position sensor greater than 7.8%.
- DTC P2715 runs continuously.

Conditions for Setting the DTC

P2714 - Condition 1

The auxiliary gearbox ratio is greater than 50% of the 1st gear design ratio for 200 ms.

P2714 - Condition 2

The auxiliary gearbox ratio is less than 10% of the 2nd gear design ratio for 500 ms.

P2715

The auxiliary gearbox ratio is greater than 2.231 for 2 s.

Action Taken When the DTC Sets

P2714

- P2714 is a Type B DTC.
- The transmission control module commands the auxiliary gearbox into 2nd gear.

P2715

- P2715 is a Type B DTC.
- The transmission control module commands the auxiliary gearbox into Neutral until vehicle speed is less than 40 km/h (25 mph). Then the TCM commands the auxiliary gearbox into 1st gear.

Conditions for Clearing the DTC

P2714 and P2715 are Type B DTCs.

Diagnostic Aids

- DTC P2714 or P2715 set due to non-electrical transmission hydraulic/mechanical performance issues.
- If the pressure control solenoid valve 4 has no electrical faults but the transmission control module detects greater than acceptable pressure or to less than acceptable pressure DTC P2714 or P2715 is set.

Circuit/System Verification

1. Verify the transmission fluid level and condition are correct. Refer to **Transmission Fluid Level and Condition Check**.
2. Verify DTC P2720 or P2721 is not set.
 - **If DTC P2720 or P2721 is set**

Refer to **DTC P2720 or P2721**.

- **If DTC P2720 or P2721 is not set**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

3. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.
4. Clear DTC P2714 or P2715 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observe from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.

- **If none of the DTCs set**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for control solenoid valve assembly replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.
- Refer to **Transmission Fluid Level and Condition Check**.

DTC P2720 OR P2721: PRESSURE CONTROL SOLENOID 4

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Pressure Control Solenoid Valve 4 Control Circuit High Voltage Test Status	OK	Malfunction	Malfunction	OK

Circuit/System Description

The pressure control solenoid valve 4 is part of the control solenoid valve assembly which has no serviceable parts.

The transmission control module controls pressure solenoid 4 pressure by regulating the current flow through the pressure control solenoid valve 4 windings. The transmission control module determines the appropriate pressure for a given load by monitoring the throttle position sensor voltage, the engine speed and other inputs. The transmission control module then varies the duty cycle on the high side of the pressure control solenoid

valve 4 to control current flow to the solenoid. The magnetic field produced by the coil moves the solenoid's internal valve which varies pressure to the pressure regulator valve. The transmission control module controls the pressure control solenoid valve 4 by applying a varying amount of amperage to the solenoid. Current is controlled from about 20 mA for maximum line pressure to 1200 mA for minimum pressure. The transmission control module monitors the actual current to the solenoid as compared to the requested current.

Conditions for Running the DTC

P2720

- System voltage 10-16 V.
- Pressure control solenoid valve 4 output current 750 mA or more.
- This DTC runs continuously within the enabling conditions.

P2721

- System voltage 10-16 V.
- Pressure control solenoid valve 4 output current 750 mA or more.
- DTC P0970 not set.
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTC

P2720

- The transmission control module has determined that there is a short to ground in the circuit.
- The pressure control solenoid valve 4 current is 200 mA or less for 200 ms when 750 mA is commanded.

P2721

- The transmission control module has determined that there is an open or short to voltage in the circuit.
- The pressure control solenoid valve 4 current is 200 mA or less for 200 ms when 750 mA is commanded.

Action Taken When the DTC Sets

P2720

- P2720 is a Type B DTC.
- If not in 2nd gear, current gear forced to 2nd gear.
- If in 2nd gear, 2nd held until wheel speed equals 0 km/h (0 mph).

P2721

- P2721 is a Type B DTC.
- When the transmission control module has determined that there is an open in the circuit, the auxiliary

gearbox will be held in 2nd gear.

- When the transmission control module has determined that there is a short to voltage in the circuit, if commanding 2nd gear the auxiliary gearbox will be in a neutral state until wheel speed equals 40 km/h (25 mph).

Conditions for Clearing the DTC

DTC P2720 and P2721 are Type B DTCs.

Circuit/System Verification

1. Verify that all of the following scan tool parameters display OK.
 - Pressure Control Solenoid Valve 4 Control Circuit Low Voltage Test Status

- Pressure Control Solenoid Valve 4 Control Circuit High Voltage Test Status
- **If any of the parameters do NOT display OK**

Refer to Circuit/System Testing.

- **If all of the parameters display OK**
2. Verify DTC P2720 or P2721 is only set as a history DTC.
 - **If any of the DTCs are set as current**

Refer to Circuit/System Testing.

- **If any of the DTCs are only set as history**

NOTE: **After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.**

3. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.
4. Clear DTC P2720 or P2721 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs set**
6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Q8 Control Solenoid Valve Assembly connector.

- NOTE:**
- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
 - **Testing for step 3 is performed on the Q8 Control Solenoid Valve Assembly harness connector using the GY probe J-35616-2A.**
 - **Chassis ground to battery ground 25-35 ohms.**

2. Ignition ON, engine OFF.
3. Test for 2.4-2.8 V between the control circuit terminal 7 and chassis ground.
 - **If less than the specified range**

1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
2. Test for less than 10 ohms in the control circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
3. Test for infinite resistance between the control circuit terminal 7 and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance.
4. Test for infinite resistance between the control circuit terminal 7 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If greater than the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for infinite resistance between the control circuit terminal 7 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If within the specified range**
4. Sensor signal circuit, low reference circuit and K71 Transmission Control Module OK.

Component Testing

Pressure Control Solenoid Valve 4

1. Disconnect the Q8 Control Solenoid Valve Assembly harness connector.

NOTE:

- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
- **Testing for Step 2 is performed on the Q8 Control Solenoid Valve Assembly connector using the GY probe J-35616-3.**

2. Measure the resistance between the control circuit, terminal 7 and chassis ground. Refer to **Temperature Versus Resistance (ECT)** for resistance values.
 - **If the resistance is not within the specified range for the given temperature**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.
 - **If the resistance IS within the specified range for the given temperature**

3. Pressure control solenoid 4 OK.

Temperature Versus Resistance

Temp (°C/°F)	Normal Range ohms	Nominal ohms
20/68	5.1-5.5	5.3
30/86	5.3-5.7	5.5
40/104	5.6-6.0	5.8
50/122	5.8-6.2	6.0
60/140	6.0-6.4	6.2
70/158	6.3-6.7	6.5
80/176	6.5-6.9	6.7

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.

DTC P2763 OR P2764: TORQUE CONVERTER CLUTCH (TCC) PRESSURE CONTROL SOLENOID

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC P2763

Torque Converter Clutch (TCC) Pressure Control Solenoid Valve Control Circuit High Voltage

DTC P2764

Torque Converter Clutch (TCC) Pressure Control Solenoid Valve Control Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P2764	P2763	P2763	-

Circuit/System Description

The torque converter clutch pressure control solenoid valve is part of the control solenoid valve assembly which has no serviceable parts.

The transmission control module torque converter clutch pressure control solenoid pressure by regulating the current flow through the torque converter clutch pressure control solenoid valve windings. The transmission control module determines the appropriate pressure for a given load by monitoring the throttle position sensor voltage, the engine speed and other inputs. The transmission control module then varies the duty cycle on the high side of the torque converter clutch pressure control solenoid valve to control current flow to the solenoid. The magnetic field produced by the coil moves the solenoids internal valve which varies pressure to the pressure regulator valve. The transmission control module controls the torque converter clutch pressure control solenoid valve by applying a varying amount of amperage to the solenoid. Current is controlled from about 20 mA for maximum line pressure to 1200 mA for minimum pressure. The transmission control module monitors the actual current to the solenoid as compared to the requested current.

Conditions for Running the DTC

P2763

- System voltage 10-16 V.
- Torque converter clutch pressure control solenoid valve output current 750 mA or more.
- This DTCs runs continuously within the enabling conditions.

P2764

- System voltage 10-16 V.
- Torque converter clutch pressure control solenoid valve output current 750 mA or more.
- This DTCs runs continuously within the enabling conditions.

Conditions for Setting the DTC

P2763

- The transmission control module has determined that there is an open or short to voltage in the circuit.
- The torque converter clutch pressure control solenoid valve current is 200 mA or less for 5 s when 750 mA is commanded.

P2764

- The transmission control module has determined that there is a short to ground in the circuit.
- The torque converter clutch pressure control solenoid valve current is 200 mA or less for 480 ms when 750 mA is commanded.

Action Taken When the DTC Sets

- DTC P2763 and P2764 are Type B DTCs.
- Lock-up is prohibited.
- Engine torque is controlled until sufficient clutch operation is obtained.

Conditions for Clearing the DTC

DTC P2763 and P02764 are Type B DTCs.

Circuit/System Verification

1. Verify that the following scan tool parameters track each other as engine RPM changes.
 - Actual TCC Pressure Control Solenoid Valve Current
 - Desired TCC Pressure Control Solenoid Valve Current

- **If the parameters do not track each other as engine speed RPM changes**

Refer to Circuit/System Testing.

- **If the parameters do track each other as engine speed RPM changes**

2. Verify DTC P2763 or P2764 is only set as a history DTC.

- **If any of the DTCs are set as current**

Refer to Circuit/System Testing.

- **If any of the DTCs are only set as history**

NOTE: After inspection, apply Nyogel lubricant 760G to each connector terminal. Ensure each connector and CPA is correctly seated.

3. Visually inspect each connector terminal of the K71 transmission control module X2 connector and the Q8 Control Solenoid Valve Assembly connector for damage or corrosion. Repair as necessary.
4. Clear DTC P2763 or P2764 from history.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. The DTC should not set.

- **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs set**

6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Q8 Control Solenoid Valve Assembly connector.

- NOTE:**
- When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.
 - Testing for step 3 is performed on the Q8 Control Solenoid Valve Assembly harness connector using the GY probe J-35616-2A.
 - Chassis ground to battery ground 25-35 ohms.

2. Ignition ON, engine OFF.
3. Test for 2.4-2.8 V between the control circuit terminal 8 and chassis ground.

- **If less than the specified range**

1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.

2. Test for less than 10 ohms in the control circuit end to end.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms.
3. Test for infinite resistance between the control circuit terminal 8 and chassis ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance.
4. Test for infinite resistance between the control circuit terminal 8 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If greater than the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K71 Transmission Control Module.
 2. Test for infinite resistance between the control circuit terminal 8 and all other terminals of Q8 Control Solenoid Valve Assembly harness connector.
 - If less than infinite resistance, repair the shorted together condition in the affected circuits.
 - If infinite resistance, replace the K71 Transmission Control Module. Refer to **Transmission Control Module Replacement**.
 - **If within the specified range**
4. Sensor signal circuit, low reference circuit and K71 Transmission Control Module OK.

Component Testing

Torque Converter Clutch Pressure Control Solenoid

1. Disconnect the Q8 Control Solenoid Valve Assembly harness connector.

NOTE:

- **When test probing harness terminals, it is imperative to use the proper test probe from the most current version of the J-35616 GM-Approved Terminal Test Kit. Use of an improper test probe may deform the terminal, resulting in intermittent open conditions.**
- **Testing for Step 2 is performed on the Q8 Control Solenoid Valve Assembly connector using the GY probe J-35616-3.**

2. Measure the resistance between the control circuit, terminal 8 and chassis ground. Refer to **Temperature Versus Resistance (ECT)** for resistance values.
 - **If the resistance is not within the specified range for the given temperature**

Replace the T12 Automatic Transmission Assembly. Refer to **Transmission Replacement**.
 - **If the resistance IS within the specified range for the given temperature**
3. Torque converter clutch pressure control solenoid OK.

Temperature Versus Resistance

Temp (°C/°F)	Normal Range ohms	Nominal ohms
20/68	5.1-5.5	5.3
30/86	5.3-5.7	5.5
40/104	5.6-6.0	5.8
50/122	5.8-6.2	6.0
60/140	6.0-6.4	6.2
70/158	6.3-6.7	6.5
80/176	6.5-6.9	6.7

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for K71 Transmission Control Module replacement, programming and setup.
- Refer to **Transmission Replacement** for transmission replacement.

SYMPTOMS - AUTOMATIC TRANSMISSION

On-Vehicle Repair Matrix

Symptom	Possible Cause
Increasing Engine Speed in Drive, Low or Reverse but No Vehicle Start	• Engine System • Incorrect ATF Level Adjustment • Improper Line Pressure Value • Shift Control Cable • TCM • Transmission Range (TR) Switch • Primary Speed Sensor • Secondary Speed Sensor • Secondary Pressure Sensor • Line Pressure Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • CVT Fluid Temperature Sensor • Control Valve Body • Oil Pump • Pulley, Steel Belt • Low Brake • Reverse Brake

	• Counter Gear • Planetary Gear • Reduction Gear • Final Gear, Differential Gear
Engine Stall in Drive, Low or Reverse and No Vehicle Start	• Shift Control Cable • TCM • Transmission Range (TR) Switch • Primary Speed Sensor • Secondary Speed Sensor • Secondary Pressure Sensor • Primary Pressure Solenoid Valve • Line Pressure Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • CVT Fluid Temperature Sensor • Control Valve Body • Bearings • Counter Gear • Planetary Gear • Reduction Gear • Final Gear, Differential Gear • Parking Mechanism
Insufficient Acceleration at Start in Drive, Low or Reverse during Driving	• Engine System • Improper Line Pressure Value • TCM • Transmission Range (TR) Switch • Primary Speed Sensor • Secondary Speed Sensor • Output Speed Sensor • Secondary Pressure Sensor • Primary Pressure Solenoid Valve • Line Pressure Solenoid Valve • Torque Converter Clutch Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • CVT Fluid Temperature Sensor • Control Valve Body

	• Torque Converter • Low Brake • Reverse Brake
Suddenly Increasing Engine Speed in Drive, Low or Reverse during Driving	• Incorrect ATF Level Adjustment • Improper Line Pressure Value • Secondary Pressure Sensor • Primary Pressure Solenoid Valve • Line Pressure Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • Control Valve Body • Oil Pump • Pulley, Steel Belt • Low Brake • High Clutch • Reverse Brake
Suddenly Applied Engine Brake in Drive or Reverse during Driving	• Engine System • Improper Line Pressure Value • Primary Pressure Solenoid Valve • Line Pressure Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • Control Valve Body • Low Brake • High Clutch • Reverse Brake
Engine Racing from 1st to 2nd Gear or 2nd to 1st Gear	• Engine System • Improper Line Pressure Value • Line Pressure Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • Control Valve Body • Oil Pump • Pulley, Steel Belt • Low Brake • High Clutch
	• Improper Line Pressure Value

Ineffective Engine Braking in Low	• Shift Control Cable • TCM • Transmission Range (TR) Switch • Primary Speed Sensor • Secondary Speed Sensor • Primary Pressure Solenoid Valve • Line Pressure Solenoid Valve • Torque Converter Clutch Solenoid Valve • Low Brake Solenoid Valve • Control Valve Body • Oil Pump • Torque Converter • Pulley, Steel Belt • Low Brake • High Clutch
Immediate Engine Stall before Stop at Deceleration in Drive or Low	• Output Speed Sensor • Torque Converter Clutch Solenoid Valve • Control Valve Body • Torque Converter
Slippage in Lock Up or Impossible Lock Up during Driving in Drive	• TCM • Transmission Range (TR) Switch • Primary Speed Sensor • Secondary Speed Sensor • Output Speed Sensor • Secondary Pressure Sensor • Primary Pressure Solenoid Valve • Line Pressure Solenoid Valve • Torque Converter Clutch Solenoid Valve • CVT Fluid Temperature Sensor • Control Valve Body • Torque Converter
Large Shock at Start in Drive,	• Improper Line Pressure Valve • Secondary Pressure Sensor • Line Pressure Solenoid Valve • Torque Converter Clutch Solenoid Valve • Control Valve Body • Pulley, Steel Belt

Low or Reverse	• Low Brake • Reverse Brake • Counter Gear • Planetary Gear • Reduction Gear • Final Gear, Differential Gear
Large Shock from 1st to 2nd Gear	• Engine System • Improper Line Pressure Value • TCM • Primary Pressure Solenoid Valve • Line Pressure Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • Control Valve Body • Low Brake • High Clutch
Large Shock in Lock Up during Driving in Drive or Low	• TCM • Torque Converter Clutch Solenoid Valve • Control Valve Body • Torque Converter
Large Shock when the Selector Lever Is Shifted from Neutral to Drive and from Neutral to Reverse	• Engine System • Improper Line Pressure Value • TCM • Transmission Range (TR) Switch • Primary Speed Sensor • Secondary Speed Sensor • Line Pressure Solenoid Valve • Torque Converter Clutch Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • CVT Fluid Temperature Sensor • Control Valve Body • Low Brake • Reverse Brake
	• Engine System • Incorrect ATF Level Adjustment • Improper Line Pressure Value

Vibration in Drive, Low or Reverse during Driving	• TCM • Output Speed Sensor • Secondary Pressure Sensor • Torque Converter Clutch Solenoid Valve • High Clutch and Reverse Brake Solenoid Valve • Low Brake Solenoid Valve • Control Valve Body • Oil Pump • Torque Converter • Pulley, Steel Belt • Low Brake • High Clutch • Reverse Brake • Bearings • Counter Gear • Planetary Gear • Reduction Gear • Final Gear, Differential Gear
Noise during Driving	• Incorrect ATF Level Adjustment • Control Valve Body • Oil Pump • Pulley, Steel Belt • Bearings • Counter Gear • Planetary Gear • Reduction Gear • Final Gear, Differential Gear
Noise in Idling	• Engine System • Incorrect ATF Level Adjustment • Control Valve Body • Oil Pump • Pulley, Steel Belt • Bearings • Counter Gear • Planetary Gear
Operative Starter in Drive, Low or Reverse	• Shift Control Cable • TCM

	• Transmission Range (TR) Switch
Inoperative Starter in Park or Neutral	• Shift Control Cable • TCM • Transmission Range (TR) Switch
Engine Stall in Drive, Low or Reverse during Stop	• Engine System • TCM • Output Speed Sensor • Torque Converter Clutch Solenoid Valve • Control Valve Body • Oil Pump • Torque Converter
Engine Stall in Park or Neutral during Stop	• Engine System • TCM • Output Speed Sensor • Torque Converter Clutch Solenoid Valve
Inoperative Parking Lock in Park	• TCM • Transmission Range (TR) Switch • Parking Mechanism
No Cancelled Parking Lock when Selector Lever Is Shifted from Park to Other	• TCM • Transmission Range (TR) Switch • Parking Mechanism

TRANSMISSION ADAPTIVE PRESSURE RESET

The Transmission Adaptive Pressure Reset procedure is used to synchronize the transmission control module with the ROM assembly in the transmission.

The Transmission Adaptive Pressure Reset procedure must be performed whenever one of the following repairs have been made to the vehicle. Failure to perform the procedure after one of the following repairs may result in poor transmission performance, as well as transmission DTCs being set:

- Transmission Control Module replacement
- Transmission Control Module software/calibration update
- Transmission replacement

NOTE: **Ensure the following conditions are met before performing the Transmission Adaptive Pressure Reset procedure:**

- Drive wheels are blocked
- Parking brake is applied

- Transmission Adaptive Pressure Reset may abort if the transmission fluid temperature increases above 110°C (230°F).

1. Use the scan tool to navigate to Transmission Adaptive Pressure Reset by selecting the following:
 1. Module Diagnostics
 2. Transmission Control Module
 3. Configurations/Reset Functions
 4. Transmission Adaptive Pressure Reset

NOTE: **If at any time during the procedure, the required conditions are not met, Transmission Adaptive Pressure Reset may abort and the process may need to be started again from the beginning.**

2. Use the scan tool to perform the Transmission Adaptive Pressure Reset procedure. This takes about 10 seconds. Scan tool confirmation of procedure completion may not happen.
3. Once the procedure is complete, shut OFF the engine and power down the transmission control module. You will lose communication to the scan tool.
4. Restart the engine. This will complete the Transmission Adaptive Pressure Reset procedure.

Procedure Verification

Proper execution of the Transmission Adaptive Pressure Reset procedure can be confirmed by the driver by verifying acceptable garage shifts into and out of Park, Reverse and Drive.

REPAIR INSTRUCTIONS - ON VEHICLE

AUTOMATIC TRANSMISSION RANGE SELECTOR LEVER REPLACEMENT

Fig. 6: NO CONTENT

Automatic Transmission Range Selector Lever Replacement

Callout	Component Name
Preliminary Procedures 1. Ensure that the shift control range select lever is in the park (P) position. 2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> . 3. Disconnect the shift control cable from the transmission range selector lever. 4. Depress the shift control cable retainer clip tabs and remove the shift control cable from the shift control cable bracket.	
1	Automatic Transmission Range Selector Lever Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 17 (13 lb ft)
2	Automatic Transmission Range Selector Lever Washer
3	Automatic Transmission Range Selector Lever

RANGE SELECTOR LEVER CABLE REPLACEMENT

Removal Procedure

1. Set the park brake and chock the wheels.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

Fig. 7: Transmission Range Selector Lever Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

3. Position the transmission manual shift lever into the park position.
4. Disconnect the transmission range selector lever cable terminal (1) from the transmission range selector lever.
5. Press the retainer clip tabs inward in order to release the transmission range selector lever cable (2) from the cable bracket.

Fig. 8: Cable And Cable Clamp

Courtesy of GENERAL MOTORS COMPANY

6. Disconnect the cable (1) from the cable clamp (2).
7. Remove the console. Refer to **Front Floor Console Replacement** .

Fig. 9: Transmission Range Selector Lever Cable Terminal And Shift Lever Pin

Courtesy of GENERAL MOTORS COMPANY

9. Install the transmission range selector lever cable (2) to the cable bracket.
10. Connect the transmission range selector lever cable terminal (1) to the transmission range selector lever.
11. Adjust the automatic transmission range selector lever cable. Refer to **Range Selector Lever Cable Adjustment**.
12. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

RANGE SELECTOR LEVER CABLE ADJUSTMENT

Adjustment Procedure

NOTE: **Adjust the automatic transmission range selector cable while the transmission and the gear selector are in the Park position only. Failure to do so may cause miss-adjustment.**

1. Set the park brake and chock the wheels.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
3. Verify the transmission range select lever is in the park (P) position.
4. Verify the transmission manual shift lever is in the P position.

Fig. 15: Transmission Range Selector Lever Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the transmission range selector lever cable terminal (1) from the transmission range selector lever.
6. Press the retainer clip tabs inward in order to release the transmission range selector lever cable (2) from the cable bracket.

Fig. 16: Cable Adjuster And Cable Adjuster Guide
Courtesy of GENERAL MOTORS COMPANY

7. Pull up on the cable adjuster (1) from the cable adjuster guide (2).

Fig. 17: Transmission Range Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

8. Install the transmission range selector lever cable (2) to the cable bracket.
9. Connect the range selector lever cable adjuster (1) to the transmission range selector lever pin.

Fig. 18: Cable Adjuster Guide

Courtesy of GENERAL MOTORS COMPANY

10. Pull up on the cable adjuster guide (1) to secure in place.
11. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
12. Check the transmission range select lever in all gear selections for proper operation.

RANGE SELECTOR LEVER CABLE BRACKET REPLACEMENT

Removal Procedure

1. Set the park brake and chock the wheels.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

Fig. 19: Transmission Range Selector Lever Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the transmission range selector lever cable terminal (1) from the range selector lever.
4. Disconnect the range selector lever cable (2) from the range selector lever cable bracket.

Fig. 20: Transmission Range Selector Cable Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the transmission range selector cable bracket bolts (1).
6. Remove the transmission range selector cable bracket (2).

Installation Procedure

Fig. 21: Transmission Range Selector Cable Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission range selector cable bracket (2).

CAUTION: Refer to Fastener Caution .

2. Install the transmission range selector lever cable bracket bolts (1) and tighten to 22 (16 lb ft).

Fig. 22: Transmission Range Selector Lever Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

3. Connect the range selector lever cable (2) to the range selector lever cable bracket.
4. Connect the transmission range selector lever cable terminal (1) to the range selector lever.
5. Check the range selector lever cable adjustment. Refer to **Range Selector Lever Cable Adjustment**.
6. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

TRANSMISSION CONTROL LEVER KNOB REPLACEMENT

Fig. 23: Transmission Control Lever Knob
 Courtesy of GENERAL MOTORS COMPANY

Transmission Control Lever Knob Replacement

Callout	Component Name
1	Transmission Control Lever Knob Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 (27 lb in)
2	Transmission Control Lever Knob Procedure Remove the transmission control lever knob from the transmission control.

TRANSMISSION CONTROL REPLACEMENT

Fig. 24: Transmission Control
 Courtesy of GENERAL MOTORS COMPANY

Transmission Control Replacement

Callout	Component Name
Preliminary Procedure Remove floor console. Refer to Front Floor Console Replacement .	
1	Transmission Control Fastener (Qty: 4) CAUTION: Refer to Fastener Caution . Procedure 1. Remove the clips on the wiring harness and disconnect the shift control electrical connector. 2. Disconnect the shift control cable. Tighten 9 (80 lb in)
2	Transmission Control

PARK/NEUTRAL POSITION SWITCH REPLACEMENT

Special Tools

DT-51175 Range Switch Alignment Checker

Removal Procedure

1. Remove the automatic transmission range select lever. Refer to [Automatic Transmission Range Selector Lever Replacement](#).

Fig. 25: PNP Switch Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the PNP switch electrical connector (1) from the PNP switch (2).
3. Remove the PNP switch bolts (3).
4. Remove the PNP switch (2) from the transaxle.

Installation Procedure

Fig. 26: NEW PNP Switch

Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW PNP switch (1) to the transmission and temporarily tighten the PNP switch bolts (2).

Fig. 27: Selector Lever

Courtesy of GENERAL MOTORS COMPANY

2. Install the selector lever (1) to the manual shaft.
3. Move the selector lever to neutral (N) position.
4. Remove the selector lever from the manual shaft.

Fig. 28: Range Switch Alignment Checker
Courtesy of GENERAL MOTORS COMPANY

5. Set **DT-51175** range switch alignment checker to the PNP switch and adjust neutral (N) position of PNP switch.

Fig. 29: PNP Switch Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: After adjusting the switch, verify the engine only starts in Park or Neutral. If the engine starts in any other position, adjust the switch.

6. Install the PNP switch bolts (1) and tighten to 6 (53 lb in).
7. Remove **DT-51175** range switch alignment checker from the PNP switch.

Fig. 30: PNP Switch Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

8. Connect the PNP switch electrical connector (1) to the PNP switch.
9. Install the automatic transmission range selector lever. Refer to **Automatic Transmission Range Selector Lever Replacement**.

PARK/NEUTRAL POSITION SWITCH ADJUSTMENT

Special Tools

DT-51175 Range Switch Alignment Checker

Adjustment Procedure

1. Remove the automatic transmission range select lever. Refer to **Automatic Transmission Range Selector Lever Replacement**.

Fig. 31: PNP Switch Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the PNP switch electrical connector (1) from the PNP switch (2).
3. Make sure the transmission manual shaft is in the neutral (N) position.
4. Loosen, DO NOT REMOVE the PNP switch bolts (3).

Fig. 32: Range Switch Alignment Checker
Courtesy of GENERAL MOTORS COMPANY

5. Set **DT-51175** range switch alignment checker to the PNP switch and adjust neutral (N) position of PNP switch.

Fig. 33: PNP Switch Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: After adjusting the switch, verify the engine only starts in Park or Neutral. If the engine starts in any other position, adjust the switch.

6. Tighten the PNP switch bolts (1) 6 (53 lb in).
7. Remove **DT-51175** range switch alignment checker from the PNP switch.

Fig. 34: PNP Switch Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

8. Connect the PNP switch electrical connector (1) to the PNP switch.
9. Install the automatic transmission range selector lever. Refer to **Automatic Transmission Range Selector Lever Replacement**.

TRANSMISSION FLUID DRAIN AND FILL (MAINTENANCE)

CAUTION: Use correct transmission fluid only. Failure to use the proper fluid may result in transmission internal damage.

1. The vehicle must level.
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 35: Drain Plug And Overflow Tube
Courtesy of GENERAL MOTORS COMPANY

3. Remove the drain plug (1) and overflow tube (3) and drain transmission fluid into a suitable container.
4. Install the drain plug (1) with the OLD drain plug gasket (2).

Fig. 36: Air Cleaner Assembly

Courtesy of GENERAL MOTORS COMPANY

5. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
6. Press the tab (1) using a small flat-bladed screwdriver and then remove the fill cap (2).
7. Pour approximately 3.0L (3.17 qt) of the transmission fluid into the charging pipe (3).
8. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
9. Start the engine.
10. Move through the selector lever positions with the foot brake depressed. Switch the selector lever from position P to L and back to P. Hold each position for at least 5 seconds.
11. Stop the engine.
12. Remove the drain plug and then drain transmission fluid from the oil pan.
13. Repeat the above steps 4-12 (one time).

Fig. 37: Drain Plug And Overflow Tube
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

14. Install the overflow tube (3) and tighten to 15 (11 lb ft).
15. Install the drain plug (1) with a NEW plug gasket (2) and tighten to 34 (25 lb ft).
16. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .
17. Pour approximately 3.0L (3.17 qt) of the transmission fluid into the charging pipe.
18. Install the fill cap.
19. Install the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .
20. Check the ATF level. Refer to Transmission Fluid Level and Condition Check.

TRANSMISSION FLUID DRAIN AND FILL (REPAIR)

CAUTION: Use correct transmission fluid only. Failure to use the proper fluid may result in transmission internal damage.

Transmission Fluid Drain

1. The vehicle must be level.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 38: Drain Plug And Overflow Tube
Courtesy of GENERAL MOTORS COMPANY

3. Remove the drain plug (1) and overflow tube (3) and drain transmission fluid into a suitable container.

CAUTION: Refer to Fastener Caution .

4. Install the overflow tube (3) and tighten to 15 (11 lb ft).
5. Install the drain plug (1) with the OLD plug gasket (2).

Transmission Fluid Fill

Fig. 39: Air Cleaner Assembly

Courtesy of GENERAL MOTORS COMPANY

1. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
2. Press the tab (1) using a small flat-bladed screwdriver and then remove the fill cap (2).
3. Pour approximately 3.0L (3.17 qt) (6.0L/6.3 qt dry transmission) of the transmission fluid into the transmission fill tube (3).
4. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
5. Start the engine.
6. Move through the selector lever positions with the foot brake depressed. Switch the selector lever from position P to L and back to P. Hold each position for at least 5 seconds.

Fig. 40: Drain Plug

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Perform this work with the engine idling.
- Do not re-use drain plug gasket, replace with a NEW gasket.

7. Check the transmission fluid temperature with the diagnostic tool.
 1. Run the engine until the transmission fluid temperature has reached 50-80°C (122-176°F).
 2. Remove the drain plug (1). Remove and DISCARD the drain plug gasket (2).
 3. If the fluid is flowing as a steady stream, wait until the fluid begins to drip. If no fluid comes out, add the fluid until it drips out.
 4. When the fluid drips out from overflow tube, install the drain plug (1) with a NEW gasket (2) and tighten to 34 (25 lb ft).
8. Turn off the engine.

TRANSMISSION FLUID COOLER PIPE CONNECTOR REPLACEMENT - RADIATOR

Removal Procedure

1. Drain the cooling system. Refer to Cooling System Draining and Filling .
2. Remove the transaxle oil cooler hoses from the oil cooler fittings on the radiator. Refer to Transmission

Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection.

Fig. 41: View Of Oil Cooler Fitting At Radiator
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not remove the upper and lower transaxle oil cooler fittings from the radiator at the same time; otherwise the transaxle oil cooler will fall inside the radiator end tank.

3. Remove the oil cooler fitting from the radiator.

Installation Procedure

1. Inspect the new O-ring seals for cracks, cuts or damage. Replace if necessary.

Fig. 42: View Of Oil Cooler Fitting At Radiator
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: The correct thread engagement is critical. Cross-threaded fittings can achieve proper tightness and still leak.

2. Install the oil cooler fitting to the radiator and tighten to 20 (15 lb ft).
3. Install the transaxle oil cooler hoses to the oil cooler fittings on the radiator. Refer to Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection.
4. Fill the cooling system. Refer to Cooling System Draining and Filling .
5. Adjust the transmission fluid level. Refer to Transmission Fluid Level and Condition Check.
6. Inspect for fluid leaks.

TRANSMISSION FLUID COOLER HOSE/PIPE QUICK-CONNECT FITTING DISCONNECTION AND CONNECTION

Removal Procedure

Fig. 43: Automatic Transmission Oil Cooler Fitting Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

NOTE: Perform the following procedure when removing the retaining rings and cooler lines from the quick connect fittings located on the radiator and/or the transmission.

1. Pull the plastic cap back from the quick connect fitting and down along the cooler line about 5 cm (2 in).
2. Using a bent-tip screwdriver, pull on one of the open ends of the retaining ring (1) in order to rotate the retaining ring around the quick connect fitting until the retaining ring is out of position and can be completely removed.
3. Remove the retaining ring from the quick connect fitting.
4. Discard the retaining ring.

Fig. 44: Automatic Transmission Cooler Line
Courtesy of GENERAL MOTORS COMPANY

5. Pull the cooler line (1) straight out from the quick connect fitting (2).

Installation Procedure

NOTE:

- Do not reuse any of the existing oil lines or oil line fittings if there is excessive corrosion.
- Do not reuse any of the existing retaining rings that were removed from the existing quick connect fittings. Install new retaining rings.
- Ensure the following procedures are performed when installing the new retaining rings onto the fittings.

1. Install a new retaining ring into the quick connect fitting using the following procedure:

Fig. 45: Automatic Transmission Oil Cooler Fitting Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

2. Hook one of the open ends of the retaining ring (1) in one of the slots in the quick connect fitting.

Fig. 46: Rotating Automatic Transmission Oil Cooler Fitting Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

3. Rotate the retaining ring (1) around the fitting until the retaining ring is positioned with all three ears through the three slots on the fitting.

Fig. 47: Automatic Transmission Oil Cooler Fitting Retaining Ring Caution
Courtesy of GENERAL MOTORS COMPANY

4. Do not install the new retaining ring (1) onto the fitting by pushing the retaining ring.

Fig. 48: Retaining Ring Ears

Courtesy of GENERAL MOTORS COMPANY

5. Ensure that the three retaining ring ears are seen from inside the fitting (1) and that the retaining ring moves freely in the fitting slots.

Fig. 49: Cutaway View Of Automatic Transmission Oil Cooler Fitting
Courtesy of GENERAL MOTORS COMPANY

6. Install the cooler line (1) into the quick connect fitting (2).
7. Insert the cooler line end into the quick connect fitting until a click is either heard or felt.

Fig. 50: Automatic Transmission Oil Cooler Line And Fitting Caution
Courtesy of GENERAL MOTORS COMPANY

8. Do not use the plastic cap (1) on the cooler line in order to install the cooler line into the fitting.
9. Pull back sharply on the cooler line in order to ensure that the cooler line is fastened into the quick connect fitting.

Fig. 51: Automatic Transmission Oil Cooler Fitting Plastic Cap
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not manually depress the retaining clip when installing the plastic cap.

10. Position (snap) the plastic cap (1) onto the fitting. Do not manually depress the retaining ring when installing the plastic cap onto the quick connect fitting.
11. Ensure that the plastic cap is fully seated against the fitting.

Fig. 52: Automatic Transmission Oil Cooler Fitting Plastic Cap Caution
Courtesy of GENERAL MOTORS COMPANY

12. Ensure that no gap is present between the plastic cap (1) and the fitting (2).

Fig. 53: Yellow Identification Band
Courtesy of GENERAL MOTORS COMPANY

13. Ensure that the yellow identification band (1) on the tube is hidden within the quick connect fitting.

Fig. 54: Yellow Identification Band Caution
Courtesy of GENERAL MOTORS COMPANY

14. A hidden yellow identification band (1) indicates proper joint seating.
15. Fill the transmission to the proper level. Refer to **Transmission Fluid Level and Condition Check.**

OUTPUT SPEED SENSOR REPLACEMENT

Fig. 55: Output Speed Sensor
 Courtesy of GENERAL MOTORS COMPANY

Output Speed Sensor Replacement

Callout	Component Name
Preliminary Procedure Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
1	Output Speed Sensor Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the output speed sensor electrical connector. Tighten 6 (53 lb in)
2	Output Speed Sensor
3	Output Speed Sensor O-Ring Seal NOTE: Do not reuse the output speed sensor O-ring seal.

PRIMARY INPUT SPEED SENSOR REPLACEMENT

Fig. 56: Primary Input Speed Sensor
 Courtesy of GENERAL MOTORS COMPANY

Primary Input Speed Sensor Replacement

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the left front compartment splash shield. Refer to <u>Front Compartment Splash Shield Replacement</u> .	
1	Primary Input Speed Sensor Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the primary input speed sensor electrical connector. Tighten 6 (53 lb in)
2	Primary Input Speed Sensor
3	Primary Input Speed Sensor O-Ring Seal NOTE: Do not reuse the primary input speed sensor O-ring seal.

SECONDARY INPUT SPEED SENSOR REPLACEMENT

Fig. 57: Secondary Input Speed Sensor
Courtesy of GENERAL MOTORS COMPANY

Secondary Input Speed Sensor Replacement

Callout	Component Name
Preliminary Procedures	
1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> . 3. Remove the battery tray. Refer to <u>Battery Tray Replacement</u> .	
1	Secondary Input Speed Sensor Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the secondary input speed sensor electrical connector. Tighten 6 (53 lb in)
2	Secondary Input Speed Sensor
	Secondary Input Speed Sensor O-Ring Seal

3

NOTE:

Do not reuse the secondary input speed sensor O-ring seal.

TRANSMISSION CONTROL MODULE REPLACEMENT

Fig. 58: Transmission Control Module
Courtesy of GENERAL MOTORS COMPANY

Transmission Control Module Replacement

Callout	Component Name
1	TCM Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 7 (62 lb in)
2	Transmission Control Module (TCM) Procedure 1. Disconnect the TCM electrical connector. 2. The TCM must be programmed when replaced. Refer to <u>Control Module References</u> for programming and setup information.

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - LEFT SIDE

Fig. 59: Front Wheel Drive Shaft Seal - Left Side
 Courtesy of GENERAL MOTORS COMPANY

Front Wheel Drive Shaft Seal Replacement - Left Side

Callout	Component Name
Preliminary Procedures	
1. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the left wheel drive shaft. Refer to <u>Front Wheel Drive Shaft Replacement</u> .	
1	Left Front Wheel Drive Shaft Oil Seal Procedure 1. For seal removal, use DT-7004 slide hammer with DT-586 seal remover. 2. For seal installation, use DT-51323 seal installer. NOTE: The new seal should be pressed to the correct depth from transmission case end surface. Specification

Approx. 0.9 mm (0.035 in)

Special Tools

- **DT-51323** Seal Installer
- **DT-586** Seal Remover
- **DT-7004** Slide Hammer

For equivalent regional tools, refer to **Special Tools** .

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - RIGHT SIDE

Fig. 60: Front Wheel Drive Shaft Seal - Right Side
Courtesy of GENERAL MOTORS COMPANY

Front Wheel Drive Shaft Seal Replacement - Right Side

Callout	Component Name
Preliminary Procedures	
1. Raise the vehicle. Refer to Lifting and Jacking the Vehicle .	
2. Remove the right wheel drive shaft. Refer to Front Wheel Drive Shaft Replacement .	
	Right Front Wheel Drive Shaft Oil Seal
Procedure	

1. For seal removal, use **DT-7004** slide hammer with **DT-586** seal remover.
2. For seal installation, use **DT-446** seal installer.

Special Tools

1

- **DT-446** Seal Installer
- **DT-586** Seal Remover
- **DT-7004** Slide Hammer

For equivalent regional tools, refer to **Special Tools** .

CONTROL VALVE BODY COVER REPLACEMENT

Fig. 61: Control Valve Body Cover

Courtesy of GENERAL MOTORS COMPANY

Control Valve Body Cover Replacement

Callout	Component Name
Preliminary Procedure	
Drain the transmission. Refer to repair Transmission Fluid Drain and Fill (Maintenance) , Transmission Fluid Drain and Fill (Repair) .	
	Control Valve Body Cover Bolt (Qty: 14)
	CAUTION:

1	Refer to <u>Fastener Caution</u> . NOTE: Install all control valve body cover bolts by hand then tighten all bolts in specified sequence. Tighten 6 (53 lb in)
2	Magnet (Qty: 2)
3	Gasket NOTE: Do not reuse the gasket.
4	Control Valve Body Cover

CONTROL VALVE BODY REPLACEMENT

The control valve body is not serviceable separately. Refer to **Transmission Replacement**.

TRANSMISSION REAR MOUNT BRACKET REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Using a suitable jack stand, support the rear of the powertrain.

Fig. 62: Transmission Bracket Mount

Courtesy of GENERAL MOTORS COMPANY

3. Remove the transmission bracket mount to mount through bolt and nut (1).

Fig. 63: Transmission Mount To Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the transmission mount to transmission bolts (1).
5. Remove the transmission mount bracket (2).

Installation Procedure

Fig. 64: Transmission Mount To Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission mount bracket (2).

CAUTION: Refer to Fastener Caution .

2. Install the transmission mount to transmission bolts (1) and tighten to 60 (44 lb ft).

Fig. 65: Transmission Bracket Mount
Courtesy of GENERAL MOTORS COMPANY

3. Install the transmission bracket mount to mount through bolt and nut (1) and tighten to 80 (59 lb ft).
4. Remove the jack stand.
5. Lower the vehicle.

TRANSMISSION REAR MOUNT REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Using a suitable jack stand, support the rear of the powertrain.

Fig. 66: Transmission Bracket Mount

Courtesy of GENERAL MOTORS COMPANY

3. Remove the transmission bracket mount to mount through bolt and nut (1).

Fig. 67: Transmission Mount To Frame Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Remove the transmission mount to frame bolt (1).
5. Remove the transmission mount (2).

Installation Procedure

Fig. 68: Transmission Mount To Frame Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission mount (2).

CAUTION: Refer to Fastener Caution .

2. Install the transmission mount to frame bolt (1) and tighten to 100 (74 lb ft).

Fig. 69: Transmission Bracket Mount
Courtesy of GENERAL MOTORS COMPANY

3. Install the transmission bracket mount to mount through bolt and nut (1) and tighten to 80 (59 lb ft).
4. Remove the jack stand.
5. Lower the vehicle.

TRANSMISSION MOUNT BRACKET REPLACEMENT - LEFT SIDE

Special Tools

EN-28467 Engine Fixture

For equivalent regional tools, refer to **Special Tools** .

Removal Procedures

1. Remove the battery tray. Refer to **Battery Tray Replacement** .
2. Install the **EN-28467** engine fixture. Refer to **Engine Support Fixture** .
3. Remove the left transmission mount. Refer to **Transmission Mount Replacement - Left Side**.

Fig. 70: Left Transmission Mount Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the left transmission mount bracket bolts (1).
5. Remove the left transmission mount bracket from the vehicle.

Installation Procedure

Fig. 71: Left Transmission Mount Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the left transmission mount bracket to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the left transmission mount bracket bolts (1) and tighten to 60 (44 lb ft).
3. Install the left transmission mount. Refer to Transmission Mount Replacement - Left Side.
4. Remove the **EN-28476** engine fixture. Refer to Engine Support Fixture .
5. Install the battery tray. Refer to Battery Tray Replacement .

TRANSMISSION MOUNT REPLACEMENT - LEFT SIDE

Special Tools

EN-28467 Engine Fixture

For equivalent regional tools, refer to Special Tools .

Removal Procedure

1. Remove the battery tray. Refer to Battery Tray Replacement .
2. Install the engine support fixture. Refer to Engine Support Fixture .

Fig. 72: Location Of Bolts And Nut
Courtesy of GENERAL MOTORS COMPANY

3. Remove the left transmission mount bolts (1) and nut (2) from the transmission mount bracket.

Fig. 73: Left Transmission Mount And Body Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the left transmission mount to body bolts (1).
5. Remove the transmission mount (2) from the vehicle.

Installation Procedure

Fig. 74: Left Transmission Mount And Body Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission mount (2) to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the transmission mount to body bolts (1) and tighten to 50 (37 lb ft).

Fig. 75: Location Of Bolts And Nut
Courtesy of GENERAL MOTORS COMPANY

3. Install the left transmission mount bolts (1) and nut (2) to transmission mount bracket and tighten to 95 (70 lb ft).
4. Remove the EN-28467 engine fixture. Refer to Engine Support Fixture .
5. Install the battery tray. Refer to Battery Tray Replacement .

TRANSMISSION REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Drain the transmission fluid. Refer to repair Transmission Fluid Drain and Fill (Maintenance), Transmission Fluid Drain and Fill (Repair).
3. After removing the related parts for the powertrain assembly removal, remove the powertrain assembly from the vehicle. Refer to Engine Replacement (LFM) , Engine Replacement (LL0) .
4. Remove the starter. Refer to Starter Replacement .

Fig. 76: Torque Converter Bolts

Courtesy of GENERAL MOTORS COMPANY

5. Remove and discard the torque converter bolts (1).

Fig. 77: Bayonet Ring

Courtesy of GENERAL MOTORS COMPANY

6. Rotate bayonet ring (3) counterclockwise to pull out the transmission wiring harness electrical connector upward and disconnect it.
7. Disconnect the output speed sensor electrical connector.
8. Disconnect the primary speed sensor electrical connector.
9. Disconnect the secondary speed sensor electrical connector.
10. Disconnect the park/neutral position (PNP) switch electrical connector.
11. Remove the crankshaft position sensor. Refer to **Crankshaft Position Sensor Replacement** .

Fig. 78: Radiator Inlet And Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

12. Remove the radiator inlet and outlet hose clamp (1).
13. Disconnect the radiator inlet and outlet hoses (2, 3) and remove the radiator and condenser assembly (4).
14. Disconnect the oil cooler pipes from the transmission. Refer to **Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Aisin 80-40LE)** , **Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Jatco CVT)** .

Fig. 79: Selector Control Cable Clamp Bolt
Courtesy of GENERAL MOTORS COMPANY

15. Remove the selector control cable clamp bolt (1) and clamp (2).
16. Separate the related wiring harness from the transmission.
17. Remove the front wheel drive shaft from the transmission. Refer to **Front Wheel Drive Shaft Replacement** .
18. Remove the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement**.
19. Remove the transmission rear mount. Refer to **Transmission Rear Mount Replacement**.
20. Remove the left transmission mount bracket. Refer to **Transmission Mount Bracket Replacement - Left Side**.

Fig. 80: Torque Converter Cover Plate Bolts
Courtesy of GENERAL MOTORS COMPANY

21. Remove the torque converter cover plate bolts (1).
22. Remove the torque converter cover plate (2).

Fig. 81: Transmission Upper Bolts
Courtesy of GENERAL MOTORS COMPANY

23. Remove the transmission upper bolts (1).
24. Remove the transmission lower bolt (2).
25. Remove the transmission lower nut (3).
26. Separate the transmission from the engine.

Installation Procedure

Fig. 82: Transmission Upper Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission to the engine.

CAUTION: Refer to Fastener Caution .

2. Install the transmission lower nut (3) and tighten to 61 (44 lb ft).
3. Install the transmission lower bolt (2) and tighten to 61 (44 lb ft).
4. Install the transmission upper bolts (1) and tighten to 61 (44 lb ft).

Fig. 83: Torque Converter Cover Plate Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install the torque converter cover plate (2).
6. Install the torque converter cover plate bolts (1) and tighten to 10 (89 lb in).
7. Install the left transmission mount bracket. Refer to **Transmission Mount Bracket Replacement - Left Side**.
8. Install the transmission rear mount. Refer to **Transmission Rear Mount Replacement**.
9. Install the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement**.
10. Install the front wheel drive shaft to the transmission. Refer to **Front Wheel Drive Shaft Replacement**.
11. Position the wiring harness into the transmission.

Fig. 84: Selector Control Cable Clamp Bolt
Courtesy of GENERAL MOTORS COMPANY

12. Install clamp (2) and the selector control cable clamp bolt (1) tighten to 22 (16 lb ft).

Fig. 85: Radiator Inlet And Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

13. Connect the oil cooler pipes to the transmission. Refer to, **Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Jatco CVT)** .
14. Install the radiator and condenser assembly (4) and connect the radiator inlet and outlet hoses (2, 3).
15. Install the radiator inlet and outlet hose clamp (1).
16. Install the crankshaft position sensor. Refer to **Crankshaft Position Sensor Replacement** .
17. Connect the park/neutral position (PNP) switch electrical connector.
18. Connect the secondary speed sensor electrical connector.
19. Connect the primary speed sensor electrical connector.
20. Connect the output speed sensor electrical connector.

Fig. 86: Bayonet Ring

Courtesy of GENERAL MOTORS COMPANY

21. Align the marking (1) on the transmission harness connector terminal with the marking (2) on bayonet ring (3) to insert the connector.

Fig. 87: Bayonet Ring

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Securely align the marking on the harness connector terminal body with the bayonet ring slit. Then, be careful not to make a half fit condition.
- Never mistake the slit of the bayonet ring for other dent portion.

22. Rotate the bayonet ring (3) clockwise until the marking (1) on the transmission harness connector terminal body is aligned with the slit (2) on bayonet ring.

Fig. 88: Torque Converter Bolts

Courtesy of GENERAL MOTORS COMPANY

23. Install NEW torque converter bolts (1) and tighten to 60 (44 lb ft).
24. Install the starter. Refer to **Starter Replacement** .
25. Install the powertrain assembly to the vehicle and then install the related parts. Refer to **Engine Replacement (LFM)** , **Engine Replacement (LL0)** .
26. Perform the transmission fluid cooler flushing and flow test. Refer to **Transmission Fluid Cooler Flushing and Flow Test (JATCO CVT)** , **Transmission Fluid Cooler Flushing and Flow Test (Aisin 80-40LE)** .
27. Check the transmission fluid for proper level. Refer to **Transmission Fluid Level and Condition Check**.
28. Reset the TCM to erase the learned data and calibration data using the scan tool.
29. Perform the transmission adaptive pressure reset when replaced. Refer to **Transmission Adaptive Pressure Reset**.

DESCRIPTION AND OPERATION

TRANSMISSION IDENTIFICATION INFORMATION

TRANSMISSION GENERAL DESCRIPTION

The model has a new CVT transmission with the following features.

Feature

Item	Contents
Improvement of transmission performance	• Direct-driven hydraulic control by a linear solenoid • Upgrade in cooperative control with the engine (CAN communication)

Improvement of driveability	The addition of an auxiliary gearbox allows top level gear ratios in the automobile industry
Improvement of fuel economy	• Compact and lightweight pulley • The addition of an auxiliary gearbox allows top level gear ratios in the automobile industry • Wide lock-up range • Friction reduction (Placement of powertrain in the upper position allows reduction in fluid agitation resistance and optimization of the oil pump discharge) • Adoption of a ultra-flat torque converter

Transmission Mechanism

Belt and Pulley Mechanism

It is composed of a pair of pulleys (the groove width is changed freely in the axial direction) and the steel belt (the steel plates are placed continuously and the belt is guided with the multilayer steel rings on both sides). The groove width changes according to wrapping radius of steel belt and pulley from low status to overdrive status continuously with non-step. It is controlled with the oil pressures of primary pulley and secondary pulley.

Steel Belt

Fig. 92: Composed Of Multiple Steel Plates
Courtesy of GENERAL MOTORS COMPANY

It is composed of multiple steel plates (1) and two steel rings (2) stacked to a several number. The feature of this steel belt transmits power with compression of the steel plate in contrast with transmission of power in pulling with a rubber belt. Friction force is required with the pulley slope to transmit power from the steel plate.

The force is generated with the following mechanism:

1. Oil pressure applies to the secondary pulley to nip the plate.
2. The plate is pushed and extended outward.
3. The steel ring shows withstands.
4. Pulling force is generated on the steel ring.
5. The plate of the primary pulley is nipped between the pulley.
6. Friction force is generated between the steel belt and the pulley.

Therefore, responsibilities are divided by the steel plate that transmits the power with compression and the steel ring that maintains necessary friction force. In this way, the tension of the steel ring is distributed on the entire surface and stress variation is limited, resulting in good durability.

Pulley

The primary pulley (input shaft side) and the secondary pulley (output shaft side) have the shaft with slope (fixed cone surface), movable sheave (movable cone surface that can move in the axial direction) and oil pressure chamber at the back of the movable sheave.

Fig. 93: Primary Pulley (Fixation Side), Secondary Side Oil Pressure Chamber And Primary Side Oil Pressure Chamber

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Primary Pulley (Fixation Side)
2	Secondary Side Oil Pressure Chamber
3	Secondary Pulley (Mobile Side)
4	Primary Side Oil Pressure Chamber
5	Primary Pulley (Mobile Side)
6	Secondary Pulley (Fixation Side)

Pulley Gear Shifting Operation

The movable sheave slides on the shaft to change the groove width of the pulley. Input signals of engine load (accelerator pedal opening), engine revolution and gear ratio (vehicle speed) change the operation pressures of the primary pulley and the secondary pulley and controls the pulley groove width. Along with change of the pulley groove width, the belt contact radius is changed. This allows continuous and stepless gear shifting from low to overdrive. "The contact radius ratio of each pulley in contact with the belt x auxiliary gearbox gear ratio" is the gear ratio.

Low Condition (Pulley Ratio = r_2/r_1)

Fig. 94: Low Condition (Pulley Ratio = r_2/r_1)
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Primary Pulley
2	Secondary Pulley
3	Narrow
4	Wide

Overdrive Condition (Pulley Ratio = r_2/r_1)

Fig. 95: Overdrive Condition (Pulley Ratio = r_2/r_1)
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Primary Pulley
2	Secondary Pulley
3	Narrow
4	Wide

Auxiliary Gearbox

1st, 2nd and reverse gears are changed with the planetary gear mechanism.

Oil Pressure System

Oil pressure required for operation of the transmission mechanism is generated by oil pump, oil pressure control valve, solenoid valve, etc.

Fig. 96: Oil Pressure System
Courtesy of GENERAL MOTORS COMPANY

The components are as follows:

- **Torque Converter** - It is composed of the cover converter, turbine assembly, stator, pump impeller assembly and etc. It increases the engine torque and transmits the power to the transmission.
- **Oil Pump** - Through the oil pump drive chain, it uses the vane oil pump driven by the engine. It generates necessary oil pressure to circulate fluid and to operate the clutch and brake.
- **Counter Gear Set** - The power from the torque converter is transmitted to the primary pulley through the counter drive gear and the counter driven gear.
- **Belt and Pulley (Continuously Variable Transmission)** - It is composed of the primary pulley, secondary pulley, steel belt, etc. and the mechanism performs shifting, changes the gear ratio and transmits the power with oil pressure from the control valve.
- **Auxiliary Gearbox (Stepped Transmission)** - It is composed of the planetary gear, multi-disc clutch, multi-disc brake, etc. and the mechanism performs shifting (1-2 gear shifting and reverse) with oil pressure from the control valve.
- **Reduction Gear Set** - Conveys power from the transmission mechanism to the reduction gear and the final gear.
- **Parking Mechanism** - When the shift lever is changed to P position, the mechanism fixes the parking gear (integrated with the reduction gear) and fixes the output shaft.
- **Valves**
 - **Control Valve**: Controls oil pressure from the oil pump to the pressure suitable for the line pressure control system, shift control system, lock-up control system and lubrication system.
 - **Pressure Regulator Valve**: Adjusts the discharge pressure from the oil pump to the optimum

pressure (line pressure) corresponding to the driving condition.

- Torque Converter Regulator Valve: Adjusts the feed pressure to the torque converter to the optimum pressure corresponding to the driving condition.
- Pilot Valve: Adjusts line pressure and produces a constant pressure (pilot pressure) necessary for activating each solenoid valve.
- Manual Valve: Distributes the clutch and brake operation pressures (pilot pressure) corresponding to each shift position.
- High Clutch/Reverse Brake Switching Valve: Switches the circuit for the high clutch and the reverse brake.
- Torque Converter Clutch Control Valve: It is operated with the torque converter clutch solenoid valve and it adjusts the tightening pressure and non-tightening pressure of the torque converter clutch piston of the torque converter.
- Primary Pressure Control Valve: It is operated with the primary pressure solenoid valve and adjusts the feed pressure to the primary pulley.
- Primary Pressure Solenoid Valve: Controls the primary pressure control valve.
- Low Brake Solenoid Valve: Adjusts the tightening pressure of the low brake.
- High Clutch and Reverse Brake Solenoid Valve: Adjusts the tightening pressure of the high clutch and reverse brake.
- Torque Converter Clutch Solenoid Valve: Controls the torque converter clutch control valve.
- Line Pressure Solenoid Valve: Controls the pressure regulator valve.

Control System

System Description

- CVT detects the vehicle driving status from switches, sensors and signals and controls the vehicle so that the optimum shift position and shift timing may always be achieved. It also controls the vehicle to reduce shift and lockup shock, etc.
- Receives input signals from switches and sensors.
- Sends the output signal necessary for operation of solenoid valves and evaluates the line pressure, shift timing lockup operation, engine brake performance, etc.
- If a malfunction occurs on the electric system, activate the fail-safe mode only to drive the vehicle.

Input/Output Signal of TCM

Control Item		Shift Control	Line Pressure Control	Select Control	Lock-up Control	Fail-Safe Function*

	Shift Position Indicator (CAN Communication)	-	-	X	-	-
* If these input/output signals show errors, TCM activates the fail-safe function.						

Fail-Safe

TCM has a fail-safe mode. The mode functions so that operation can be continued even if the signal circuit of the main electronically controlled input/output parts is damaged.

If the vehicle shows following behaviors including "poor acceleration", a malfunction of the applicable system is detected by TCM and the vehicle may be in a fail-safe mode. At this time, check the DTC code and perform inspection and repair according to the malfunction diagnosis procedures.

Protection Control

The TCM becomes the protection control status temporarily to protect the safety when the safety of TCM and transmission is lost. It automatically returns to the normal status if the safety is secured. The TCM has the following protection control.

CVT Control for Wheel Spin

Control	When a wheel spin is detected, the engine output and gear ratio are limited and the line pressure is increased. At 1st gear, the clutch
---------	---

	pressure is increased.
Vehicle Behavior in Control	If the accelerator is kept depressing during wheel spin, the engine revolution and vehicle speed are limited to a certain degree. From the 1st gear, up-shift to a certain gear ratio is only allowed.
Normal Return Condition	Wheel spin convergence returns the control to the normal control.

Control when Fluid Temperature is High

Control	When the CVT fluid temperature is high, the gear shift permission maximum revolution and the maximum torque are reduced than usual to prevent increase of the oil temperature.
Vehicle Behavior in Control	Power performance may be lowered, compared to normal control.
Normal Return Condition	The control returns to the normal control when CVT fluid temperature is lowered.

Torque is Reduced when Driving with the Reverse Gear

Control	Engine output is controlled according to a vehicle speed while reversing the vehicle.
Vehicle Behavior in Control	Power performance may be lowered while reversing the vehicle.
Normal Return Condition	Torque returns to normal by positioning the selector lever in a range other than "R" position.

Reverse Prohibit Control

Control	The reverse brake is controlled to avoid becoming engaged when the selector lever is set in "R" position while driving in forward direction at more than the specified speed.
Vehicle Behavior in Control	If the selector lever is put at "R" position when driving with the forward gear, the gear becomes neutral, not reverse.
Normal Return Condition	The control returns to normal control when the vehicle is driven at low speeds. (The reverse brake becomes engaged.)

Line Pressure Control

Highly accurate line pressure control (secondary pressure control) reduces friction for improvement of fuel economy.

- Normal Oil Pressure Control

Appropriate line pressure and secondary pressure suitable for driving condition are determined based on the accelerator pedal position, engine speed, primary pulley (input) speed, secondary pulley (output) speed, vehicle speed, input torque, stop lamp switch signal, transmission range switch signal, lock-up signal, power voltage, target shift ratio, oil temperature and oil pressure.

- Secondary Pressure Feedback Control

In normal oil pressure control and oil pressure control in shifting, highly accurate secondary pressure is

determined by detecting the secondary pressure using an oil pressure sensor and by feedback control.

Shift Control

In order to select the gear ratio which can obtain the driving force in accordance with driver's intention and the vehicle condition, the TCM monitors the driving conditions such as the vehicle speed and the throttle position and select the optimum gear ratio and determines the gear change steps to the gear ratio.

The information is output to the primary pressure solenoid valve to control the line pressure input/output to the primary pulley, to determine the primary pulley (movable pulley) position and to control the gear position.

- **Drive (D) Position**

Shifting over all the ranges of gear ratios from the lowest to the highest.

- **Low (L) Position**

By limiting the shifting range only to the lowest of the gear ratio, a large driving force and engine brake are obtained.

- **Hill Climbing and Descending Control**

When downhill is detected with the accelerator pedal released, the engine brake will be strengthened up by downshifting so as not to accelerate the vehicle more than necessary.

- **Control in Acceleration**

According to the vehicle speed and a change of accelerator pedal angle, driver's request for acceleration and driving scene are judged. This function assists improvement in acceleration feeling by making the engine speed proportionate to the vehicle speed.

Select Control

Based on accelerator pedal angle, engine speed, primary pulley speed and the secondary pulley speed, the optimum operating pressure is set to reduce impact of a selector lever operation while shifting from "N" ("P") to "D" ("R") position.

Lock-up Control

The torque converter clutch piston located in the converter is engaged to eliminate slip to increase power transmission efficiency. The control valve operation is performed by the torque converter clutch solenoid valve, which is controlled by a signal sent by the TCM. This control valve engages or releases the torque converter clutch piston directly using the pressure provided by the oil pump.

In lock-up released state, the torque converter clutch control valve is set into the unlocked state by the solenoid and the lock-up pressure apply is drained. In this way, the clutch piston is not coupled.

In the lock-up applied state, the torque converter clutch control valve is set into the locked state by the solenoid and lock-up apply pressure is generated. In this way, the clutch piston is pressed and coupled.

ELECTRONIC COMPONENT DESCRIPTION

Transmission Control Module (TCM)

The vehicle driving status is judged based on the signals from the sensors, switches and other control units and the optimal transmission control is performed.

ROM Assembly

The ROM assembly is installed to the control valve body.

The ROM assembly stores the calibration data (characteristic value).

Transmission Range Switch

The transmission range switch is installed to the upper part of transmission case and detects the selector lever position.

Primary Speed Sensor

The primary speed sensor is installed to the transmission side cover.

The primary speed sensor detects the primary pulley speed and generates an ON-OFF pulse signal according to the rotor speed.

TCM judges the rotor speed from the pulse signal.

Secondary Speed Sensor

The secondary speed sensor is installed to the transmission side cover.

The secondary speed sensor detects secondary pulley speed generates an ON-OFF pulse signal according to the rotor speed.

TCM judges the rotor speed from the pulse signal.

Output Speed Sensor

The output speed sensor is installed to the back side of transmission case.

The output speed sensor detects the final gear speed. TCM evaluates the vehicle speed from the final gear revolution.

The output speed sensor generates an ON-OFF pulse signal according to the rotor speed. TCM judges the rotor speed from the pulse signal.

CVT Fluid Temperature Sensor

The CVT fluid temperature sensor is installed to the control valve body and detects CVT fluid temperature in the oil pan.

The fluid temperature sensor uses a thermistor and changes the signal voltage by converting changes in the CVT fluid temperature to a resistance value. TCM evaluates the CVT fluid temperature from the signal voltage value.

Secondary Pressure Sensor

The secondary pressure sensor is installed to the control valve body and detects the pressure applied to the secondary pulley.

When the pressure is applied to the ceramic device in the secondary pressure sensor, the ceramic device is deformed, resulting in voltage change.

TCM evaluates the secondary pressure from its voltage change. The voltage is increased along with the pressure increase.

Primary Pressure Solenoid Valve

The primary pressure solenoid valve is installed to the control valve body and controls the primary pressure control valve.

The primary pressure solenoid valve uses the linear solenoid valve [N/H (normal high) type].

NOTE:

- The principle of the linear solenoid valve utilizes the fact that the force pressing on the valve spool installed inside the coil increases nearly in proportion to the current. This allows it to produce the fluid pressure that is proportional to this pressing force.
- The N/H (normal high) produces hydraulic control when the coil is not energized.

Low Brake Solenoid Valve

The low brake solenoid valve is installed to the control valve body and adjusts the tightening pressure of the low brake.

The low brake solenoid valve uses the linear solenoid valve [N/L (normal low) type].

NOTE:

- The principle of the linear solenoid valve utilizes the fact that the force pressing on the valve spool installed inside the coil increases nearly in proportion to the current. This allows it to produce the fluid pressure that is proportional to this pressing force.
- The N/L (normal low) does not produce hydraulic control when the coil is

not energized.

High Clutch and Reverse Brake Solenoid Valve

The high clutch & reverse brake solenoid valve is installed to the control valve body and adjusts the tightening pressure of the high clutch and reverse brake.

The high clutch & reverse brake solenoid valve uses the linear solenoid valve [N/H (normal high) type].

NOTE:

- **The principle of the linear solenoid valve utilizes the fact that the force pressing on the valve spool installed inside the coil increases nearly in proportion to the current. This allows it to produce the fluid pressure that is proportional to this pressing force.**
- **The N/H (normal high) produces hydraulic control when the coil is not energized.**

Torque Converter Clutch Solenoid Valve

The torque converter clutch solenoid valve is installed to the control valve body and controls the torque converter clutch control valve.

The torque converter clutch solenoid valve utilizes the linear solenoid valve [N/L (normal low) type].

NOTE:

- **The principle of the linear solenoid valve utilizes the fact that the force pressing on the valve spool installed inside the coil increases nearly in proportion to the current. This allows it to produce the fluid pressure that is proportional to this pressing force.**
- **The N/L (normal low) does not produce hydraulic control when the coil is not energized.**

Line Pressure Solenoid Valve

The line pressure solenoid valve is installed to the control valve body and controls the pressure regulator valve.

The line pressure solenoid valve uses the linear solenoid valve [N/H (normal high) type].

NOTE:

- **The principle of the linear solenoid valve utilizes the fact that the force pressing on the valve spool installed inside the coil increases nearly in proportion to the current. This allows it to produce the fluid pressure that is proportional to this pressing force.**
- **The N/H (normal high) produces hydraulic control when the coil is not energized.**

Oil Pressure Switch

The oil pressure switch is installed to control valve body and detects the pressure applied to the high clutch.

BASIC CHARGING SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Vehicle Will Not Start	
Dead battery	Check battery cells, alternator belt tension and alternator output
Loose or corroded battery connections	Check all charging system connections
Ignition circuit or switch malfunction	Check and replace as necessary
Alternator Light Stays On With Engine Running	
Loose or worn alternator drive belt	Check alternator drive tension and condition, See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Loose alternator wiring connections	Check all charging system connections

Short in alternator light wiring	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Defective alternator stator or diodes	See Bench Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Alternator Light Stays Off With Ignition Switch ON	
Blown fuse	See WIRING DIAGRAMS
Defective alternator	See Testing in ALTERNATOR article
Defective indicator light bulb or socket	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Alternator Light Stays OFF With Ignition Switch ON	
Short in alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective rectifier bridge	See Bench Tests in ALTERNATOR article
Lights or Fuses Burn Out Frequently	
Defective alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Defective battery	Check and replace as necessary
Ammeter Gauge Shows Discharge	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Defective wiring	Check all wires and wire connections
Defective alternator or regulator	See Bench Tests and On- Vehicle Tests in ALTERNATOR article
Defective ammeter, or improper ammeter wiring connection	See Testing in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Noisy Alternator	
Loose drive pulley	Tighten drive pulley attaching nut

Loose mounting bolts	Tighten all alternator mounting bolts
Worn or dirty bearings	See Bearing Replacement ALTERNATOR article
Defective diodes or stator	See Bench Test in ALTERNATOR article
Battery Does Stay Charged	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in appropriate TUNE-UP article in the TUNE-UP section
Loose or corroded battery connections	Check all charging system connections
Loose alternator connections	Check all charging system connections
Defective alternator or battery	See On-Vehicle Tests and Bench Tests in ALTERNATOR article
Add-on electrical accessories exceeding alternator capacity	Install larger alternator
Battery Overcharged-Uses Too Much Water	
Defective battery	Check alternator output and repair as necessary
Defective alternator	See On-Vehicle Test and Bench Tests in ALTERNATOR article
Excessive alternator voltage	Check alternator output and repair as necessary

IGNITION SYSTEM TROUBLE SHOOTING

STARTER TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole	See STARTER article shoes
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check

	for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearing	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as

	necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch	Replace ignition switch contacts sticking
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	solenoid
Low Current Draw	
Worn brushes or weak brush springs	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

AIR CONDITIONING & HEAT

AIR CONDITIONING TROUBLE SHOOTING

WARNING: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC AIR CONDITIONING TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Compressor Not Working	Compressor clutch circuit open.
.....	Compressor clutch coil inoperative.
.....	Poor clutch ground connection.
.....	Fan belts loose.
.....	Thermostatic switch inoperative.
.....	Thermostatic switch not adjusted.
.....	Ambient temperature switch open.
.....	Superheat fuse blown.
Excessive Noise or Vibration	Missing or loose mounting bolts.
.....	Bad idler pulley bearings.
.....	Fan belts not tightened correctly.
.....	Compressor clutch contacting body.
.....	Excessive system pressure.
.....	Compressor oil level low.
.....	Damaged clutch bearings.
.....	Damaged reed valves.
.....	Damaged compressor.
Insufficient or No Cooling; Compressor Working	Expansion valve inoperative.
.....	Heater control valve stuck open.
.....	Low system pressure.
.....	Blocked condenser fins.
.....	Blocked evaporator fins.
.....	Vacuum system leak.
.....	Vacuum motors inoperative.
.....	Control cables improperly adjusted.
.....	Restricted air inlet.
.....	Mode doors binding.
.....	Blower motor inoperative.

.....	Temperature above system capacity.
-------	------------------------------------

HEATER SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC HEATER SYSTEM TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Insufficient, Erratic, or No Heat	Low Coolant Level
.....	Incorrect thermostat.
.....	Restricted coolant flow through core.
.....	Heater hoses plugged.
.....	Misadjusted control cable.
.....	Sticking heater control valve.
.....	Vacuum hose leaking.
.....	Vacuum hose blocked.
.....	Vacuum motors inoperative.
.....	Blocked air inlet.
.....	Inoperative heater blower motor.
.....	Oil residue on heater core fins.
.....	Dirt on heater core fins.
Too Much Heat	Improperly adjusted cables.
.....	Sticking heater control valve.
.....	No vacuum to heater control valve.
.....	Temperature door stuck open.
Air Flow Changes During Acceleration	Vacuum system leak.
.....	Bad check valve or reservoir.
Air From Defroster At All Times	Vacuum system leak.
.....	Improperly adjusted control cables.
.....	Inoperative vacuum motor.
Blower Does Not Operate Correctly	Blown fuse.
.....	Blower motor windings open.
.....	Resistors burned out.
.....	Motor ground connection loose.
.....	Wiring harness connections loose.
.....	Blower motor switch inoperative.
.....	Blower relay inoperative.

.....	Fan binding or foreign object in housing.
.....	Fan blades broken or bent.

BRAKES

BRAKE SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BRAKE SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Brakes Pull Left or Right	
Incorrect tire pressure	Inflate tires to proper pressure
Front end out of alignment	See WHEEL ALIGNMENT
Mismatched tires	Check tires sizes
Restricted brake lines or hoses	Check hose routing
Loose or malfunctioning caliper	See DISC BRAKES or BRAKE SYSTEM
Bent shoe or oily linings	See DRUM BRAKES or BRAKE SYSTEM
Malfunctioning rear brakes	See DRUM, DISC BRAKES or BRAKE SYSTEM
Loose suspension parts	See SUSPENSION
Noises Without Brakes Applied	
Front linings worn out	Replace linings
Dust or oil on drums or rotors	See DRUM, DISC BRAKES or BRAKE SYSTEM
Noises With Brakes Applied	
Insulator on outboard shoe damaged	See DISC BRAKES or BRAKE SYSTEM
Incorrect pads or linings	Replace pads or linings
Brake Rough, Chatters or Pulsates	
Excessive lateral runout	Check rotor runout
Parallelism not to specifications	Reface or replace rotor
Wheel bearings not adjusted	See SUSPENSION
Rear drums out-of-round	Reface or replace drums
Disc pad reversed, steel against rotor	Remove and reinstall pad
Excessive Pedal Effort	
Malfunctioning power unit	See POWER BRAKES or

	BRAKE SYSTEM
Partial system failure	Check fluid and pipes
Worn disc pad or lining	Replace pad or lining
Caliper piston stuck or sluggish	See DISC BRAKES or BRAKE SYSTEM
Master cylinder piston stuck	See MASTER CYLINDERS or BRAKE SYSTEM
Brake fade due to incorrect pads for linings	Replace pads or linings
Linings or pads glazed	Replace pads or linings
Worn drums	Reface or replace drums
Excessive Pedal Travel	
Partial brake system failure	Check fluid and pipes
Insufficient fluid in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Air trapped in system	See BRAKE BLEEDING or BRAKE SYSTEM
Rear brakes not adjusted	See Adjustments in DRUM BRAKES or BRAKE SYSTEM
Bent shoe or lining	See DRUM BRAKES or BRAKE SYSTEM
Plugged master cylinder cap	See MASTER CYLINDERS or BRAKE SYSTEM
Improper brake fluid	Replace brake fluid
Pedal Travel Decreasing	
Compensating port plugged	See MASTER CYLINDERS or BRAKE SYSTEM
Swollen cup in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Master cylinder piston not returning	See MASTER CYLINDERS or BRAKE SYSTEM
Weak shoe retracting springs	See DRUM BRAKES BRAKE SYSTEM
Wheel cylinder piston sticking	See DRUM BRAKES or BRAKE SYSTEM
Dragging Brakes	
Master cylinder pistons not returning	See MASTER CYLINDERS BRAKE SYSTEM
Restricted brake lines or hoses	Check line routing
Incorrect parking brake adjustment	See DRUM BRAKES BRAKE SYSTEM
Parking Brake cables frozen	See DRUM BRAKES BRAKE SYSTEM

Incorrect installation of inboard disc pad	Remove and replace correctly
Power booster output rod too long	See POWER BRAKE UNITS BRAKE SYSTEM
Brake pedal not returning freely	See DISC, DRUM BRAKES BRAKE SYSTEM
Brakes Grab or Uneven Braking Action	
Malfunction of combination valve	See CONTROL VALVE or BRAKE SYSTEM
Malfunction of power brake unit	See POWER BRAKE UNITS or BRAKE SYSTEM
Binding brake pedal	See DISC, DRUM BRAKES or BRAKE SYSTEM
Pulsation or Roughness	
Uneven pad wear caused by caliper	See DISC BRAKES or BRAKE SYSTEM
Uneven rotor wear	See DISC BRAKES or BRAKE SYSTEM
Drums out-of-round	Reface or replace drums

ENGINE MECHANICAL

COOLING SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

COOLING SYSTEM TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Overheating	
Coolant Leak	Fill/Pressure Test System
A/C Condenser Fins Clogged	Remove/Clean Condenser
Radiator Fins Clogged	Remove/Clean Radiator
Thermostat Stuck Closed	Replace Thermostat
Clogged Cooling System Passages	Clean/Flush Cooling System
Water Pump Malfunction	Replace Water Pump
Fan Clutch Malfunction	Replace Fan Clutch
Retarded Ignition Timing	Reset Ignition Timing
Cooling Fan Malfunction	Test Cooling Fan/Circuit
Cooling Fan Motor Malfunction	Test Fan Motor
Cooling Fan Relay Malfunction	Test Fan Relay

Faulty Radiator Cap	Replace Radiator Cap
Broken/Slipping Fan Belt	Replace Fan Belt
Restricted Exhaust	Repair Exhaust System
Corrosion	
Impurities In Coolant	Clean/Flush System
Coolant Leakage	
Damaged hose	Replace Hose
Leaky Water Pump	Replace Water Pump
Damaged Radiator Seam	Replace/Repair Radiator
Leaky Thermostat Cover	Replace Thermostat Cover
Cylinder Head Problem	Check Head/Head Gasket
Leaky Freeze Plugs	Replace Freeze Plugs
Recovery System Inoperative	
Loose and/or Defective Radiator Cap	Replace Radiator Cap
Overflow Tube Clogged and/or Leaking	Repair Tube
Recovery Bottle Vent Restricted	Clean Vent
No Heater Core Flow	
Collapsed Heater Hose	Replace Heater Hose
Plugged Heater Core	Clean/Replace Heater Core
Faulty Heater Valve	Replace Heater Valve

GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Lopes At Idle	
Intake manifold-to-head leaks	Replace manifold gasket, See ENGINES
Blown head gasket	Replace head gasket, See ENGINES
Worn timing gears, chain or sprocket	Replace gears, chain or sprocket
Worn camshaft lobes	Replace camshaft, See ENGINES
Overheated engine	Check cooling system, See COOLING
Blocked crankcase vent valve	Remove restriction

Leaking EGR valve	Repair leak and/or replace valve
Faulty fuel pump	Replace fuel pump
Engine Has Low Power	
Leaking fuel pump	Repair leak and/or replace fuel pump
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Sticking valves or weak valve springs	Check valve train components, See ENGINES
Incorrect valve timing	Reset valve timing, See ENGINES
Worn camshaft lobes	Replace camshaft, See ENGINES
Blown head gasket	Replace head gasket. See ENGINES.
Clutch slipping	Adjust pedal and/or replace components, See ENGINES
Engine overheating	Check cooling system, See COOLING
Auto. Trans. pressure regulator valve faulty	Replace pressure regulator valve
Auto. Trans. fluid level too low	Add fluid as necessary
Improper vacuum diverter valve operation	Replace vacuum diverter valve
Vacuum leaks	Inspect vacuum system and repair as required
Leaking piston rings	Replace piston rings, See ENGINES
Faulty High Speed Operation	
Low fuel pump volume	Replace fuel pump
Leaking valves or worn	Replace valves and/or springs, See ENGINES
Incorrect valve timing	Reset valve timing, See ENGINES
Intake manifold restricted	Remove restriction
Worn distributor shaft	Replace distributor
Faulty Acceleration	
Improper fuel pump stroke	Remove pump and reset pump stroke
Incorrect ignition timing	Reset ignition timing, See TUNE-UP
Leaking valves	Replace valves, See ENGINES

Worn fuel pump diaphragm or piston	Replace diaphragm or piston
Intake Backfire	
Improper ignition timing	Reset ignition timing, See TUNE-UP
Faulty accelerator pump discharge	Replace accelerator pump
Improper choke operation	Check choke and adjust as required
Defective EGR valve	Replace EGR valve
Fuel mixture too lean	Reset air/fuel mixture, See TUNE-UP
Choke valve initial clearance too large	Reset choke valve initial clearance
Exhaust Backfire	
Vacuum leak	Inspect and repair vacuum system
Faulty vacuum diverter valve	Replace vacuum diverter valve
Faulty choke operation	Check choke and adjust as required
Exhaust system leak	repair exhaust system leak
Engine Detonation	
Ignition timing too far advanced	Reset ignition timing, See TUNE-UP
Faulty ignition system	Check ignition timing, See TUNE-UP
Spark plugs loose or faulty	Retighten or replace plugs
Fuel delivery system clogged	Inspect lines, pump and filter for clog
EGR valve inoperative	Replace EGR valve
PCV system inoperative	Inspect and/or replace hoses or valve
Vacuum leaks	Check vacuum system and repair leaks
Excessive combustion chamber deposits	Remove built-up deposits
Leaking, sticking or broken valves	Inspect and/or replace valves
External Oil Leakage	
Fuel pump improperly seated or worn gasket	Remove pump, replace gasket and seat properly
Oil pan gasket broken or pan bent	Straighten pan and replace gasket
Timing chain cover gasket broken	Replace timing chain cover gasket
Rear main oil seal worn	Replace rear main oil seal

Oil pan drain plug not seated properly	Remove and reinstall drain plug
Camshaft bearing drain hole blocked	Remove restriction
Oil pressure sending switch leaking	Remove and reinstall sending switch
Excessive Oil Consumption	
Worn valve stems or guides	Replace stems or guides, See ENGINES
Valve "O" ring seals damaged	Replace "O" ring seals, See ENGINES
Plugged oil drain back holes	Remove restrictions
Improper PCV valve operation	Replace PCV valve
Engine oil level too high	Remove excess oil
Engine oil too thin	Replace thicker oil
Valve stem oil deflectors damaged	Replace oil deflectors
Incorrect piston rings	Replace piston rings, See ENGINES
Piston ring gaps not staggered	Reinstall piston rings, See ENGINES
Insufficient piston ring tension	Replace rings, See ENGINES
Piston ring grooves or oil return	slots clogged Replace piston rings, See ENGINES
Piston rings sticking in grooves	Replace piston rings, See ENGINES
Piston ring grooves excessively worn	Replace piston and rings, See ENGINES
Compression rings installed upside down	Replace compression rings correctly, See ENGINES
Worn or scored cylinder walls	Rebore cylinders or replace block
Mismatched oil ring expander and rail	Replace oil ring expander and rail, See ENGINES
Intake gasket dowels too long	Replace intake gasket dowels
Excessive main or connecting rod bearing clearance	Replace main or connecting rod bearings, See ENGINES
No Oil Pressure	
Low oil level	Add oil to proper level
Oil pressure sender or gauge broken	Replace sender or gauge
Oil pump malfunction	Remove and overhaul oil pump, See ENGINES
Oil pressure relief valve sticking	Remove and reinstall valve
Oil pump passages blocked	Overhaul oil pump, See ENGINES

Oil pickup screen or tube blocked	Remove restriction
Loose oil inlet tube	Tighten oil inlet tube
Loose camshaft bearings	Replace camshaft bearings, See ENGINES
Internal leakage at oil passages	Replace block or cylinder head
Low Oil Pressure	
Low engine oil level	Add oil to proper level
Engine oil too thin	Remove and replace with thicker oil
Excessive oil pump clearance	Reduce oil pump clearance, See ENGINES
Oil pickup tube or screen blocked	Remove restrictions
Main, rod or cam bearing clearance excessive	Replace bearing to reduce clearance, See ENGINES
High Oil Pressure	
Improper grade of oil	Replace with proper oil
Oil pressure relief valve stuck closed	Eliminate binding
Oil pressure sender or gauge faulty	Replace sender or gauge
Noisy Main Bearings	
Inadequate oil supply	Check oil delivery to main bearings
Excessive main bearing clearance	Replace main bearings, See ENGINES
Excessive crankshaft end play	Replace crankshaft, See ENGINES
Loose flywheel or torque converter	Tighten attaching bolts
Loose or damaged vibration damper	Tighten or replace vibration damper
Crankshaft journals out-of-round	Re-grind crankshaft journals
Excessive belt tension	Loosen belt tension
Noisy Connecting Rods	
Excessive bearing clearance or missing bearing	Replace bearing, See ENGINES
Crankshaft rod journal out-of-round	Re-grind crankshaft journal
Misaligned connecting rod or cap	Remove rod or cap and realign
Incorrectly tightened rod bolts	Remove and re-tighten rod bolts
Noisy Pistons and Rings	
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Bore tapered or out-of-round	Rebore block

Piston ring broken	Replace piston rings, See ENGINES
Piston pin loose or seized	Replace piston pin, See ENGINES
Connecting rods misaligned	Realign connecting rods
Ring side clearance too loose or tight	Replace with larger or smaller rings
Carbon build-up on piston	Remove carbon
Noisy Valve Train	
Worn or bent push rods	Replace push rods, See ENGINES
Worn rocker arms or bridged pivots	Replace push rods, See ENGINES
Dirt or chips in valve lifters	Remove lifters and remove dirt/chips
Excessive valve lifter leak-down	Replace valve lifters, See ENGINES
Valve lifter face worn	Replace valve lifters, See ENGINES
Broken or cocked valve springs	Replace or reposition springs
Too much valve stem-to-guide clearance	Replace valve guides, See ENGINES
Valve bent	Replace valve, See ENGINES
Loose rocker arms	Retighten rocker arms, See ENGINES
Excessive valve seat run-out	Reface valve seats, See ENGINES
Missing valve lock	Install new valve lock
Excessively worn camshaft lobes	Replace camshaft, See ENGINES
Plugged valve lifter oil holes	Eliminate restriction or replace lifter
Faulty valve lifter check ball	Replace lifter check ball, See ENGINES
Rocker arm nut installed upside down	Remove and reinstall correctly
Valve lifter incorrect for engine	Remove and replace valve lifters
Faulty push rod seat or lifter plunger	Replace plunger or push rod
Noisy Valves	
Improper valve lash	Re-adjust valve lash, See ENGINES
Worn or dirty valve lifters	Clean and/or replace lifters
Worn valve guides	Replace valve guides, See ENGINES

Excessive valve seat or face run-out	Reface seats or valve face
Worn camshaft lobes	Replace camshaft, See ENGINES
Loose rocker arm studs	Re-tighten rocker arm studs, See ENGINES
Bent push rods	Replace push rods, See ENGINES
Broken valve springs	Replace valve springs, See ENGINES
Burned, Sticking or Broken Valves	
Weak valve springs or warped valves	Replace valves and/or springs, See ENGINES
Improper lifter clearance	Re-adjust clearance or replace lifters
Worn guides or improper guide clearance	Replace valve guides, See ENGINES
Out-of-round valve seats or improper seat width	Re-grind valve seats
Gum deposits on valve stems, seats or guide	Remove deposits
Improper spark timing	Re-adjust spark timing
Broken Pistons/Rings	
Undersize pistons	Replace with larger pistons, See ENGINES
Wrong piston rings	Replace with correct rings, See ENGINES
Out-of-round cylinder bore	Re-bore cylinder bore
Improper connecting rod alignment	Remove and realign connecting rods
Excessively worn ring grooves	Replace pistons, See ENGINES
Improperly assembled piston pins	Re-assemble pin-to-piston, See ENGINES
Insufficient ring gap clearance	Install new rings, See ENGINES
Engine overheating	Check cooling system
Incorrect ignition timing	Re-adjust ignition timing, See TUNE-UP
Excessive Exhaust Noise	
Leaks at manifold to head, or to pipe	Replace manifold or pipe gasket
Exhaust manifold cracked or broken	Replace exhaust manifold, See ENGINES

ENGINE PERFORMANCE

CARBURETOR TROUBLE SHOOTING:

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC COLD START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Choke not closing	Check choke operation, see FUEL SYSTEMS
Choke linkage bent	Check linkage, see FUEL SYSTEM
Engine Starts, Then Dies	
Choke vacuum kick setting too wide	Check setting and adjust see, FUEL SYSTEMS
Fast idle RPM too low	Reset RPM to specification, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Vacuum leak	Inspect vacuum system for leaks
Low fuel pump outlet	Repair or replace pump, see FUEL SYSTEMS
Low carburetor fuel level	Check float setting see FUEL SYSTEM
Engine Quits Under Load	
Choke vacuum kick setting incorrect	Reset vacuum kick setting, see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEM
Incorrect hot fast idle speed RPM	Reset fast idle RPM, see TUNE-UP
Engine Starts, Runs Up, Then Idles, Slowly With Black Smoke	
Choke vacuum kick set too narrow	Reset vacuum kick, see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Hot fast idle RPM too low	Reset fast idle RPM, see TUNE-UP

BASIC HOT START SYMPTOMS TROUBLE SHOOTING CHART

--	--

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Engine flooded	Allow fuel to evaporate

BASIC COLD ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Stalls in Gear	
Choke vacuum kick setting incorrect	Reset choke vacuum kick, see FUEL SYSTEMS
Fast idle RPM incorrect	Reset fast idle RPM, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam see FUEL SYSTEMS
Acceleration Sag or Stall	
Defective choke control switch	Replace choke control switch
Choke vacuum kick setting incorrect	Reset choke vacuum kick see, FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, FUEL SYSTEMS
Accelerator pump defective	Repair or replace pump see FUEL SYSTEMS
Secondary throttles not closed	Inspect lockout adjustment, see FUEL SYSTEMS
Sag or Stall After Warmup	
Defective choke control switch	Replace choke control switch, see FUEL SYSTEMS
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, see FUEL SYSTEMS
Backfiring & Black Smoke	
Plugged heat crossover system	Remove restriction

BASIC WARM ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Hesitation With Small Amount of Gas Pedal Movement	
Vacuum leak	Inspect vacuum lines
Accelerator pump weak or inoperable	Replace pump, see FUEL SYSTEMS
Float level setting too low	Reset float level, see, FUEL SYSTEMS
Metering rods sticking or binding	Inspect and/or replace rods, see FUEL SYSTEMS

Carburetor idle or transfer system plugged	Inspect system and remove restriction
Frozen or binding heated air inlet	Inspect heated air door for binding
Hesitation With Heavy Gas Pedal Movement	
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Metering rod carrier sticking or binding	Remove restriction
Large vacuum leak	Inspect vacuum system and repair leak
Float level setting too low	Reset float level, see FUEL SYSTEMS
Defective fuel pump, lines or filter	Inspect pump, lines and filter
Air door setting incorrect	Adjust air door setting, see FUEL

DIESEL ENGINE TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

NOTE: Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.

BASIC DIESEL ENGINE TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Crank	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Bad starter connections or bad starter	Check connections and/or replace starter
Engine Cranks Slowly, Won't Start	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Engine oil too heavy	Replace engine oil
Engine Cranks Normally, But Will Not Start	
Glow plugs not functioning	Check glow plug system, see FUEL SYSTEMS
Glow plug control not functioning	Check controller, see FUEL SYSTEMS

Fuel not injected into cylinders	Check fuel injectors, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Fuel filter blocked	Replace fuel filter
Fuel tank filter blocked	Replace fuel tank filter
Fuel pump not operating	Check pump operation and/or replace pump
Fuel return system blocked	Inspect system and remove restriction
No voltage to fuel solenoid	Check solenoid and connections
Incorrect or contaminated fuel	Replace fuel
Incorrect injection pump timing	Re-adjust pump timing, see FUEL SYSTEMS
Low compression	Check valves, pistons, rings, see ENGINES
Injection pump malfunction	Inspect and/or replace injection pump
Engine Starts, Won't Idle	
Incorrect slow idle adjustment	Reset idle adjustment, see TUNE-UP
Fast idle solenoid malfunctioning	Check solenoid and connections
Fuel return system blocked	Check system and remove restrictions
Glow plugs go off too soon	See glow plug diagnosis in FUEL SYSTEMS
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Incorrect or contaminated fuel	Replace fuel
Low compression	Check valves, piston, rings, see ENGINES
Injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Fuel solenoid closes in RUN position	Check solenoid and connections
Engines Starts/Idles Rough W/out Smoke or Noise	
Incorrect slow idle adjustment	Reset slow idle, see TUNE-UP
Injection line fuel leaks	Check lines and connections
Fuel return system blocked	Check lines and connections
Air in fuel system	Bleed air from system
Incorrect or contaminated fuel	Replace fuel

Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engines Starts and Idles Rough W/out Smoke or Noise, But Clears After Warm-Up	
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Engine not fully broken in	Put more miles on engine
Air in system	Bleed air from system
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engine Idles Correctly, Misfires Above Idle	
Blocked fuel filter	Replace fuel filter
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Incorrect or contaminated fuel	Replace fuel
Engine Won't Return To Idle	
Fast idle adjustment incorrect	Reset fast idle, see TUNE-UP
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
External linkage binding	Check linkage and remove binding
Fuel Leaks On Ground	
Loose or broken fuel line	Check lines and connections
Internal injection pump seal leak	Replace injection pump, see FUEL SYSTEMS
Cylinder Knocking Noise	
Injector nozzles sticking open	Test injectors, see FUEL SYSTEMS
Very low nozzle opening pressure	Test injectors and/or replace
Loss of Engine Power	
Restricted air intake	Remove restriction
EGR valve malfunction	Replace EGR valve
Blocked or damaged exhaust system	Remove restriction and/or replace components
Blocked fuel tank filter	Replace filter
Restricted fuel filter	Remove restriction and/or replace filter
Block vent in gas cap	Remove restriction and/or replace cap
Tank-to-injection pump fuel supply blocked	Check fuel lines and connections
Blocked fuel return system	Remove restriction
Incorrect or contaminated fuel	Replace fuel
Blocked injector nozzles	Check nozzle for blockage, see

	FUEL SYSTEMS
Low compression	Check valves, rings, pistons, see ENGINES
Loud Engine Noise With Black Smoke	
Basic timing incorrect	Reset timing, see FUEL SYSTEMS
EGR valve malfunction	Replace EGR valve
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Incorrect injector pump housing pressure	Check pressure, see FUEL SYSTEMS
Engine Overheating	
Cooling system leaks	Check cooling system and repair leaks
Belt slipping or damaged	Check tension and/or replace belt
Thermostat stuck closed	Remove and replace thermostat, see ENGINE COOLING
Head gasket leaking	Replace head gasket
Oil Light on at Idle	
Low oil pump pressure	Check oil pump operation, see ENGINES
Oil cooler or line restricted	Remove restriction and/or replace cooler
Engine Won't Shut Off	
Injector pump fuel solenoid does not return fuel valve to OFF position	Remove and check solenoid and replace if needed

VACUUM PUMP DIAGNOSIS

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

FUEL INJECTION TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble

Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC FUEL INJECTION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start (Crankes Normally)	
Cold start valve inoperative	Test valve and circuit
Poor connection;vacuum or wiring	Check vacuum and electrical connections
Contaminated fuel	Test fuel for water or alcohol
Defective fuel pump relay or circuit	Test relay and wiring
Battery too low	Charge and test battery
Low fuel pressure	Test pressure regulator and fuel pump, check for restricted lines and filters
No distributor reference pulses	Repair ignition system as necessary
Open coolant temperature sensor circuit	Test sensor and wiring
Shorted W.O.T. switch in T.P.S.	Disconnect W.O.T. switch, engine should start
Defective ECM	Replace ECM
Fuel tank residual pressure valve leaks	Test for fuel pressure drop after shut down
Hard Starting	
Disconnected hot air tube to air cleaner	Reconnect tube and test control valve
Defective Idle Air Control (IAC) valve	Test valve operation and circuit
Shorted, open or misadjusted T.P.S.	Test and adjust or replace T.P.S.
EGR valve open	Test EGR valve and control circuit
Poor Oxygen sensor signal	Test for shorted or circuit
Incorrect mixture from PCV system	Test PCV for flow, check sealing of oil filter cap
Poor High Speed Operation	
Low fuel pump volume	Faulty pump or restricted fuel lines or filters
Poor MAP sensor signal	Test MAP sensor, vacuum hose and wiring
Poor Oxygen sensor signal	Test for shorted or open sensor or circuit

Open coolant temperature sensor circuit	Test sensor and wiring
Faulty ignition operation	Check wires for cracks or poor connections, test secondary voltage with oscilloscope
Contaminated fuel	Test fuel for water or alcohol
Intermittent ECM ground	Test ECM ground connection for resistance
Restricted air cleaner	Replace air cleaner
Restricted exhaust system	Test for exhaust manifold back pressure
Poor MAF sensor signal	Check leakage between sensor and manifold
Poor VSS signal	If tester for ALCL hook-up is available check that VSS reading matches speedometer
Ping or Knock on Acceleration	
Poor Knock sensor signal	Test for shorted or open sensor or circuit
Poor Baro sensor signal	Test for shorted or open sensor or circuit
Improper ignition timing	See VEHICLE EMISSION CONTROL LABEL (where applicable)
Check for engine overheating problems	Low coolant, loose belts or electric cooling fan inoperative

NOTE: For additional electronic fuel injection trouble shooting information, see the appropriate article in the ENGINE PERFORMANCE section (not all vehicles have Computer Engine Control articles). Information is provided there for diagnosing fuel system problems on vehicles with electronic fuel injection.

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

Ignition Secondary Trouble shooting Chart

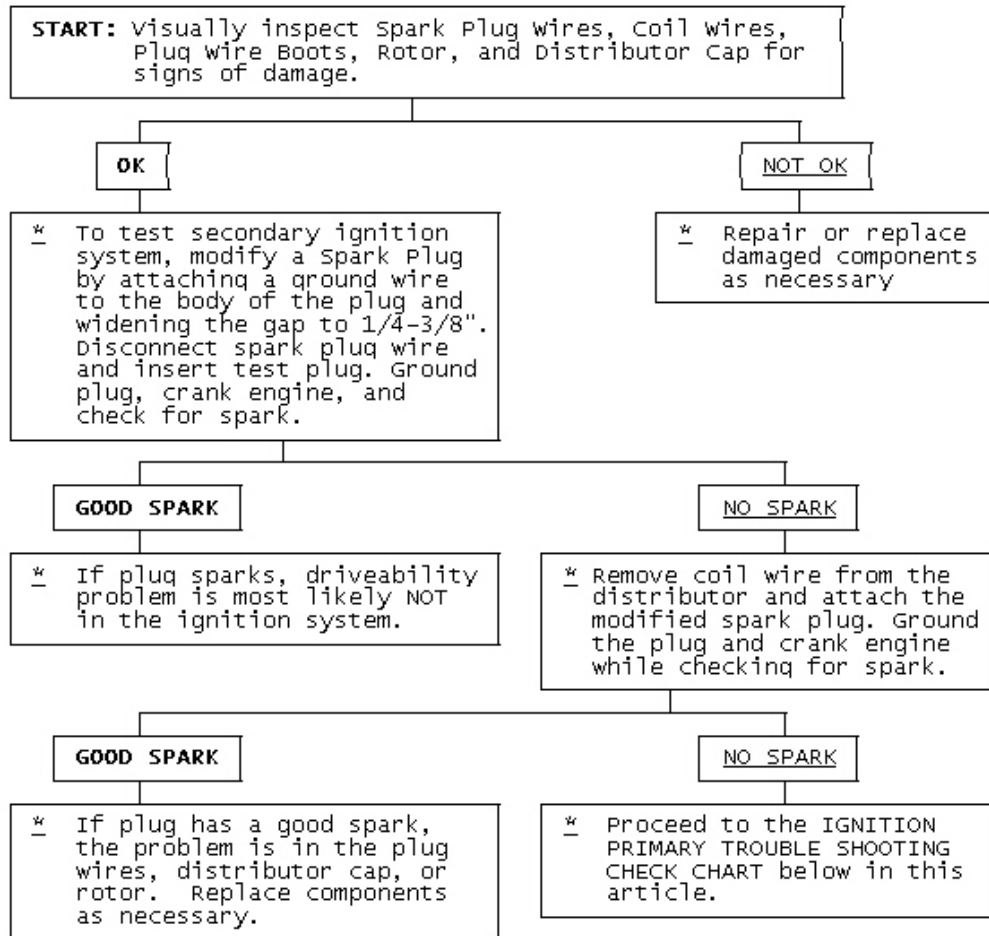

Fig. 3: Ignition Secondary Trouble Shooting Chart

Ignition Primary Trouble Shooting Chart

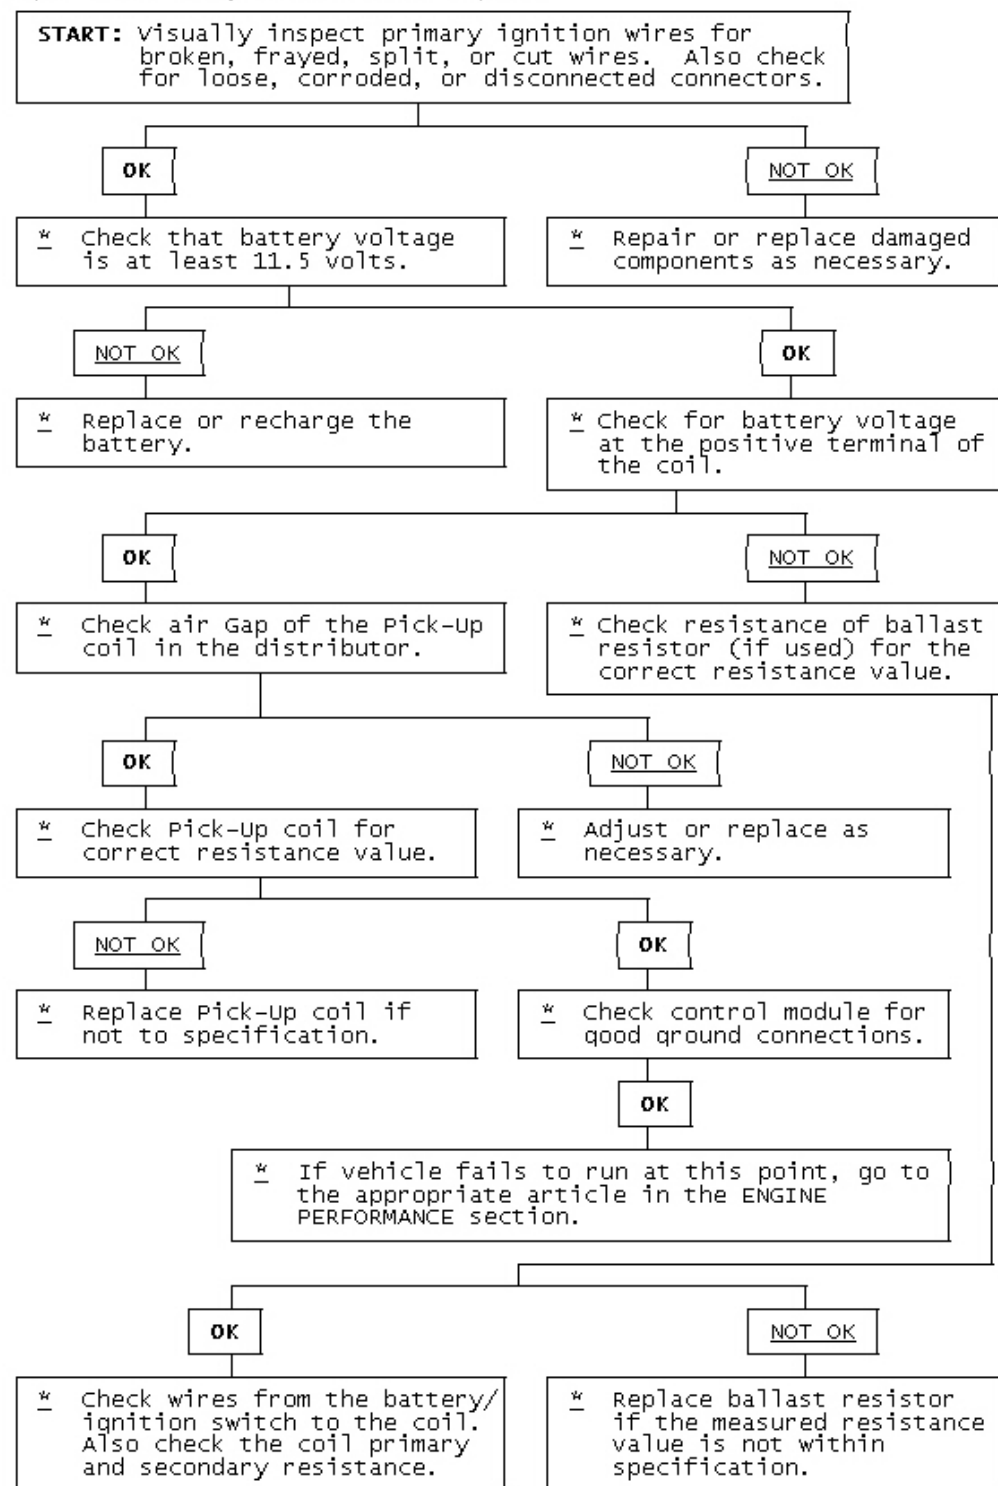

Fig. 4: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	See Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole shoes	See STARTER article
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	

Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearings	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER

	article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch contacts sticking	Replace ignition switch
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	Replace solenoid
Low Current Draw	
Worn brushes or weak	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that

	correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

TUNE-UP TROUBLE SHOOTING - GAS ENGINE VEHICLES

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC SPARK PLUG TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Normal Spark Plug Condition	
Light Tan or Gray deposits	No Action
Electrode not burned or fouled	No Action
Gap tolerance not changed	No Action
Cold Fouling or Carbon Deposits	
Overrich air/fuel mixture	Adjust air/fuel mixture, see ENGINE PERFORMANCE section
Faulty choke	Replace choke assembly, see ENGINE PERFORMANCE section
Clogged air filter	Clean and/or replace air filter
Incorrect idle speed or dirty carburetor	Reset idle speed and/ or clean carburetor
Faulty ignition wires	Replace ignition wiring
Prolonged operation at idle	Shut engine off during long idle
Sticking valves or worn valve guide seals	Check valve train
Wet Fouling or Oil Deposits	
Worn rings and pistons	Install new rings and pistons
Excessive cylinder wear	Rebore or replace block
Excessive valve guide clearance	Worn or loose bearing
Gap Bridged	
Deposits in combustion chamber becoming fused to electrode	Clean combustion chamber of deposits
Blistered Electrode	
Engine overheating	Check cooling system

Wrong type of fuel	Replace with correct fuel
Loose spark plugs	Retighten spark plugs
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Pre-Ignition or Melted Electrodes	
Incorrect type of fuel	Replace with correct fuel
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Burned valves	Replace valves
Engine Overheating	Check cooling system
Wrong type of spark plug, too hot	Replace with correct spark plug, see ENGINE PERFORMANCE
Chipped Insulators	
Severe detonation	Check for over-advanced timing or combustion
Improper gapping procedure	Re-gap spark plugs
Rust Colored Deposits	
Additives in unleaded fuel	Try different fuel brand
Water In Combustion Chamber	
Blown head gasket or cracked head	Repair or replace head or head gasket

NOTE: Before diagnosing an electronic ignition system, ensure that all wiring is connected properly between distributor, wiring connector and spark plugs. Ignition problem will show up either as: Engine Will Not Start or Engine Runs Rough.

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Open circuit between distributor and bulkhead connector	Repair circuit
Open circuit between bulkhead connector and ignition switch	Repair circuit
Open circuit between ignition switch and starter solenoid	Repair circuit
Engine Runs Rough	
Fuel lines leaking or clogged	Tighten fitting, remove restriction
Initial timing incorrect	Reset ignition timing see ENGINE PERFORMANCE
Centrifugal advance malfunction	Repair distributor advance
Defective spark plugs or wiring	Replace plugs or plug wiring
Component Failure	
Spark arc-over on cap, rotor or coil	Replace cap, rotor or or coil

Defective pick-up coil	Replace pick-up coil
Defective ignition coil	Replace ignition coil
Defective vacuum unit	Replace vacuum unit
Defective control module	Replace control module

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS - USING OSCILLOSCOPE PATTERNS

CONDITION & POSSIBLE CAUSE	CORRECTION
Firing Voltage Lines are the Same, but Abnormally High	
Retarded ignition timing	Reset ignition timing, see ENGINE PERFORMANCE section
Fuel mixture too lean	Readjust carburetor, see ENGINE PERFORMANCE
High resistance in coil wire	Replace coil wire
Corrosion in coil tower terminal	Clean and/or replace coil
Corrosion in distributor coil terminal	Clean and/or replace distributor cap
Firing Voltage Lines are the Same but Abnormally Low	
Fuel mixture too rich	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in coil wire causing arcing	Replace coil wire
Cracked coil tower causing arcing	Replace coil
Low coil output	Replace coil
Low engine compression	Determine cause and repair
One or More, But Not All Firing Voltage Lines are Higher Than Others	
Carburetor idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
EGR valve stuck open	Clean and/or replace valve
High resistance in spark plug wires	Replace spark plug wires
Cracked or broken spark plug insulator	Replace spark plugs
Intake vacuum leak	Repair leak
Defective spark plugs	Replace spark plugs
Corroded spark plug terminals	Replace spark plugs
One or More, But Not All Firing Voltage Lines Are Lower Than Others	
Curb idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in plug wires	Replace plug wires causing arcing
Cracked coil tower causing arcing	Replace coil
Low compression	Determine cause and repair
Defective spark plugs	Replace spark plugs

Corroded spark plugs	Replace spark plugs
Cylinders Not Firing	
Cracked distributor cap terminals	Replace distributor cap
Shorted spark plug wire	Determine cause and repair
Mechanical problem in engine	Determine cause and repair
Defective spark plugs	Replace spark plugs
Spark plugs fouled	Replace spark plugs

BASIC DRIVEABILITY PROBLEMS TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Hard Starting	
Binding carburetor linkage	Eliminate binding
Binding choke linkage	Eliminate binding
Binding choke piston	Eliminate binding
Restricted choke vacuum	Check vacuum lines for blockage
Worn or dirty needle valve and seat	Clean carburetor, see ENGINE PERFORMANCE
Float sticking	Readjust or replace float see the ENGINE PERFORMANCE section
Incorrect choke adjustment	Reset choke adjustment see ENGINE PERFORMANCE
Defective coil	Replace coil
Improper spark plug gap	Regap spark plugs
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Detonation	
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective spark plugs	Replace spark plugs
Fuel lines clogged	Clean fuel lines
EGR system malfunction	Check and repair EGR system
PCV system malfunction	Repair PCV system
Vacuum leaks	Check and repair vacuum system
Loose fan belts	Tighten or replace fan belts, see ENGINE PERFORMANCE
Restricted airflow	Remove restriction
Vacuum advance malfunction	Check distributor operation
Dieseling	
Binding carburetor linkage	Eliminate binding

Binding throttle linkage	Eliminate blinding
Binding choke linkage or fast idle cam	Eliminate binding
Defective idle solenoid	Replace idle solenoid see ENGINE PERFORMANCE
Improper base idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Incorrect idle mixture setting	Reset idle mixture, see ENGINE PERFORMANCE
Faulty Acceleration	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Engine cold and choke too lean	Adjust choke and allow engine to warm-up
Defective spark plugs	Replace spark plugs
Defective coil	Replace coil
Faulty Low Speed Operation	
Clogged idle transfer slots	Clean idle transfer slots, see FUEL
Restricted idle air bleeds and passages	Disassemble and clean carburetor, see FUEL
Clogged air cleaner	Replace air filter
Defective spark plugs	Replace spark plugs
Defective ignition wires	Replace ignition wire see ENGINE PERFORMANCE
Defective distributor cap	Replace distributor cap
Faulty High Speed Operation	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective distributor centrifugal advance	Replace advance mechanism
Defective distributor vacuum advance	Replace advance unit
Incorrect spark plugs or plug gap	Check gap and/or replace spark plugs
Faulty choke operation	Check choke and repair as required
Clogged vacuum passages	Remove restrictions
Improper size or clogged main jet	Check jet size and clean, see FUEL
Restricted air cleaner	Check filter and replace as necessary
Defective distributor cap, rotor or coil	Replace cap, rotor or coil
Misfire at All Speeds	

Defective spark plugs	Replace spark plugs
Defective spark plug wires	Replace spark plug wires
Defective distributor cap, rotor, or coil	Replace cap, rotor, or coil
Cracked or broken vacuum hoses	Replace vacuum hoses
Vacuum leaks	Repair vacuum leaks
Fuel lines clogged	Remove restriction
Hesitation	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair Vacuum leaks
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate binding
Binding choke linkage or fast idle cam	Eliminate binding
Improper float setting	Readjust float setting, see FUEL
Cracked or broken ignition wires	Replace ignition wires
Rough Idle, Missing or Stalling	
Incorrect curb idle or fast idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect basic timing	Reset ignition timing see ENGINE PERFORMANCE
Improper idle mixture adjustment	Reset idle mixture, see ENGINE PERFORMANCE
Improper feedback system operation	Check feedback system see ENGINE PERFORMANCE
Incorrect spark plug gap	Reset spark plug gap, see ENGINE PERFORMANCE
Moisture in ignition components	Dry components
Loose or broken ignition wires	Replace ignition wires
Damaged distributor cap or or rotor	Replace distributor cap or rotor
Faulty ignition coil	Replace ignition coil
Fuel filter clogged or worn	Replace fuel filter
Damaged idle mixture screw	Replace idle mixture screw, see FUEL
Improper fast idle cam adjustment	Reset fast idle cam adjustment, see TUNE- see ENGINE PERFORMANCE
Improper EGR valve operation	Replace EGR valve
Faulty PCV valve air flow	Replace PCV valve
Choke binding or improper choke setting	Reset choke or eliminate binding
Vacuum leak	Repair vacuum leak
Improper float bowl fuel level	Reset float adjustment, see

	FUEL
Clogged air bleed or idle passages	Clean carburetor passages, see FUEL
Clogged or worn air cleaner filter	Replace air filter
Faulty choke vacuum diaphragm	Replace diaphragm, see ENGINE PERFORMANCE
Exhaust manifold heat valve inoperative	Replace heat valve
Improper distributor spark advance	Check distributor operation
Leaking valves or valve components	Check and repair valvetrain
Improper carburetor mounting	Remove and remount carburetor
Excessive play in distributor shaft	Replace distributor
Loose or corroded wiring connections	Repair or replace as required
Engine Surges	
Improper PCV valve airflow	Replace PCV valve
Vacuum leaks	Repair vacuum leaks
Clogged air bleeds	Remove restriction
EGR valve malfunction	Replace EGR valve
Restricted air cleaner filter	Replace air filter
Cracked or broken vacuum hoses	Replace vacuum hoses
Cracked or broken ignition wires	Replace ignition wires
Vacuum advance malfunction	Check unit and replace as necessary
Defective or fouled spark plugs	Replace spark plugs
Ping or Spark Knock	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Distributor centrifugal or vacuum advance malfunction	Check operation and replace as necessary
Carburetor setting too lean	Readjust mixture setting, see ENGINE PERFORMANCE
Vacuum leak	Eliminate vacuum leak
EGR valve malfunction	Replace EGR valve
Poor Gasoline Mileage	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair vacuum leaks
Defective ignition wires	Replace wires
Incorrect choke setting	Readjust setting, see ENGINE PERFORMANCE
Defective vacuum advance	Replace vacuum advance
Defective spark plugs	Replace spark plugs
Binding carburetor power piston	Eliminate binding

Dirt in carburetor jets	Clean and/or replace jets
Incorrect float adjustment	Readjust float setting, see FUEL
Defective power valve	Replace power valve, see ENGINE PERFORMANCE
Incorrect idle speed	Readjust idle speed
Engine Stalls	
Improper float level	Readjust float level
Leaking needle valve and seat	Replace needle valve and seat
Vacuum leaks	Eliminate vacuum leaks

VACUUM PUMP - DIESEL TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

NOTE: Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.

VACUUM PUMP (DIESEL) TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

MANUAL TRANSMISSION

MANUAL TRANSMISSION TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

MANUAL TRANSMISSION/TRANSAXLE TROUBLE SHOOTING

Condition	Possible Cause
Noisy In Forward Gears	Low gear oil level, Loose bell housing bolts, Worn bearings or gears
Clunk On Deceleration (FWD Only)	Loose engine mounts, Worn inboard CV joints, Worn differential pinion shaft, Side gear hub counterbore in case worn oversize
Gear Clash When Shifting Forward Gears	Clutch Out Of Adjustment, Shift linkage damaged or out of adjustment, Gears or synchronizers damaged, Low gear oil level
Transmission Noisy When Moving (RWD Only) Quiet In Neutral With Clutch Engaged	Worn rear outputshaft bearing
Gear Rattle	Worn bearings, Wrong gear oil, Low gear oil, Worn gears
Steady Ticking At Idle (Increases With RPM)	Broken tooth on gear
Gear Clash When Shifting Forward Gears	Worn or broken synchronizers
Loud Whine In Reverse	Normal condition ⁽¹⁾
Noise When Stepping On Clutch	Bad release bearing, Worn pilot bearing
Ticking Or Screeching As Clutch Is Engaged	Faulty release bearing, Uneven pressure plate fingers
Click Or Snap When Clutch Is Engaged	Worn clutch fork, Worn or broken front bearing retainer
Transmission Shifts Hard	Clutch not releasing, Shift mechanism binding, Clutch installed backwards
Will Not Shift Into One Gear, Shifts Into All Others	Bent shift fork, Worn detent balls
Locked Into Gear, Cannot Shift	Clutch adjustment, Worn detent balls
Transmission Jumps Out Of Gear	Pilot bearing worn, Bent shift fork, Worn gear teeth or face, Excessive gear train end play, Worn synchronizers, Missing detent ball spring, Shift mechanism worn or out of adjustment, Engine or transmission mount bolts loose or out of adjustment, Transmission not aligned
Shift Lever Rattle	Worn shift lever or detents, Worn shift forks, Worn synchronizers sleeve
Shift Lever Hops Under Acceleration	Worn engine or transmission mounts
(1) Most units use spur cut gears in reverse and are noisy	

POWERTRAIN

CLUTCH TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble

Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC CLUTCH TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Chattering or Grabbing	
Incorrect clutch adjustment	Adjust clutch
Oil, grease or glaze on facings	Disassemble and clean or replace
Loose "U" joint flange	See DRIVE AXLES article
Worn input shaft spline	Replace input shaft
Binding pressure plate	Replace pressure plate
Binding release lever	See CLUTCH article
Binding clutch disc hub	Replace clutch disc
Unequal pressure plate contact	Replace worn/misaligned components
Loose/bent clutch disc	Replace clutch disc
Incorrect transmission alignment	Realign transmission
Worn pressure plate, disc or flywheel	Replace damaged components
Broken or weak pressure springs	Replace pressure plate
Sticking clutch pedal	Lubricate clutch pedal & linkage
Incorrect clutch disc facing	Replace clutch disc
Engine loose in chassis	Tighten all mounting bolts
Failure to Release	
Oil or grease on clutch facings	Clean or replace clutch disc
Incorrect release lever or pedal adjustment	See CLUTCH article
Worn or broken clutch facings	Replace clutch disc
Bent clutch disc or pressure plate	Replace damaged components
Clutch disc hub binding on input shaft	Clean or replace clutch disc and/or input shaft
Binding pilot bearing	Replace pilot bearing
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Binding clutch cable	See CLUTCH article
Defective clutch master	Replace master cylinder
Defective clutch slave	Replace slave cylinder
Air in hydraulic system	Bleed hydraulic system
Rattling	
Weak or broken release lever spring	Replace spring and check alignment
Damaged pressure plate	Replace pressure plate

Broken clutch return spring	Replace return spring
Worn splines on clutch disc or input shaft	Replace clutch disc and/or input shaft
Worn clutch release bearing	Replace release bearing
Dry or worn pilot bearing	Lubricate or replace pilot bearing
Unequal release lever contact	Align or replace release lever
Incorrect pedal free play	Adjust free play
Warped or damaged clutch disc	Replace damaged components
Slipping	
Pressure springs worn or	Release pressure plate
Oily, greasy or worn facings	Clean or replace clutch disc
Incorrect clutch alignment	Realign clutch assembly
Warped clutch disc or pressure plate	Replace damaged components
Binding release levers or clutch pedal	Lubricate and/or replace release components
Squeaking	
Worn or damaged release	Replace release bearing
Dry or worn pilot or release bearing	Lubricate or replace assembly
Pilot bearing turning in crankshaft	Replace pilot bearing and/or crankshaft
Worn input shaft bearing	Replace bearing and seal
Incorrect transmission alignment	Realign transmission
Dry release fork between pivot	Lubricate release fork and pivot
Heavy and/or Stiff Pedal	
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Dry or binding clutch pedal hub	Lubricate and align components
Floor mat interference with pedal	Lay mat flat in proper area
Dry or binding ball/fork pivots	Lubricate and align components
Faulty clutch cable	Replace clutch cable
Noisy Clutch Pedal	
Faulty interlock switch	Replace interlock switch
Self-adjuster ratchet noise	Lubricate or replace self-adjuster
Speed control interlock switch	Lubricate or replace interlock switch
Clutch Pedal Sticks Down	
Binding clutch cable	See CLUTCH article
Springs weak in pressure plate	Replace pressure plate
Binding in clutch linkage	Lubricate and free linkage
Noisy	
Dry release bearing	Lubricate or replace release bearing

Dry or worn pilot bearing	Lubricate or replace bearing
Worn input shaft bearing	Replace bearing
Transmission Click	
Weak springs in pressure	Replace pressure plate plate
Release fork loose on ball stud	Replace release fork and/or ball stud
Oil on clutch disc damper	Replace clutch disc
Broken spring in slave cylinder	Replace slave cylinder

DRIVE AXLE - NOISE DIAGNOSIS

Unrelated Noises

Some driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. Ensure cause of trouble actually is in the drive axle before adjusting, repairing, or replacing any of its parts.

Non-Drive Axle Noises

A few conditions can sound just like drive axle noise and have to be considered in pre-diagnosis. The 4 most common noises are exhaust, tires, CV/universal joints and wheel trim rings.

In certain conditions, the pitch of the exhaust gases may e gear whine. At other times, it may be mistaken for a wheel bearing rumble.

Tires, especially radial and snow, can have a high-pitched tread whine or roar, similar to gear noise. Also, some non-standard tires with an unusual tread construction may emit a roar or whine.

Defective CV/universal joints may cause clicking noises or excessive driveline play that can be improperly diagnosed as drive axle problems.

Trim and moldings also can cause a whistling or whining noise. Ensure none of these components are causing the noise before disassembling the drive axle.

Gear Noise

A "howling" or "whining" noise from the ring and pinion gear can be caused by an improper gear pattern, gear damage, or improper bearing preload. It can occur at various speeds and driving conditions, or it can be continuous.

Before disassembling axle to diagnose and correct gear ke sure that tires, exhaust, and vehicle trim have been checked as possible causes.

Chuckle

This is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It occurs while decelerating from 40 MPH and usually can be heard until vehicle comes to a complete stop. The

frequency varies with the speed of the vehicle.

A chuckle that occurs on the driving phase is usually caused by clearance due to differential gear wear, or by a damaged tooth on the coast side of the pinion or ring gear. Even a very small tooth nick or a ridge on the edge of a gear tooth is enough to cause the noise.

This condition can be corrected simply by cleaning the gear tooth nick or ridge with a small grinding wheel. If either gear is damaged or scored badly, the gear set must be replaced. If metal has broken loose, the carrier and housing must be cleaned to remove particles that could cause damage.

Knock

This is very similar to a chuckle, though it may be louder, and occur on acceleration or deceleration. Knock can be caused by a gear tooth that is damaged on the drive side of the ring and pinion gears. Ring gear bolts that are hitting the carrier casting can cause knock. Knock can also be due to excessive end play in the axle shafts.

Clunk

Clunk is a metallic noise heard when an automatic transmission is engaged in Reverse or Drive, or when throttle is applied or released. It is caused by backlash somewhere in the driveline, but not necessarily in the axle. To determine whether driveline clunk is caused by the axle, check the total axle backlash as follows:

1. Raise vehicle on a frame or twinpost hoist so that drive wheels are free. Clamp a bar between axle companion flange and a part of the frame or body so that flange cannot move.
2. On conventional drive axles, lock the left wheel to keep it from turning. On all models, turn the right wheel slowly until it is felt to be in Drive condition. Hold a chalk marker on side of tire about 12" from center of wheel. Turn wheel in the opposite direction until it is again felt to be in Drive condition.
3. Measure the length of the chalk mark, which is the total axle backlash. If backlash is one inch or less, drive axle is not the source of clunk noise.

Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by malfunctioning pinion bearings. Pinion bearings operate at drive shaft speed. Roller wheel bearings may whine in a similar manner if they run completely dry of lubricant. Bearing noise will occur at all driving speeds. This distinguishes it from gear whine, which usually comes and goes as speed changes.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. It is usually caused by a malfunctioning wheel bearing. The lower pitch is because the wheel bearing turns at only about 1/3 of drive shaft speed.

Chatter On Turns

This is a condition where the entire front or rear of vehicle vibrates when vehicle is moving. The vibration is plainly felt as well as heard. Extra differential thrust washers installed during axle repair can cause a condition of partial lock-up that creates this chatter.

Axle Shaft Noise

Axle shaft noise is similar to gear noise and pinion bearing whine. Axle shaft bearing noise will normally distinguish itself from gear noise by occurring in all driving modes (Drive, cruise, coast and float), and will persist with transmission in Neutral while vehicle is moving at problem speed.

If vehicle displays this noise condition, remove suspect parts, replace wheel seals and install a new set of bearings. Re-evaluate vehicle for noise before removing any internal components.

Vibration

Vibration is a high-frequency trembling, shaking or grinding condition (felt or heard) that may be constant or variable in level and can occur during the total operating speed range of the vehicle.

The types of vibrations that can be felt in the vehicle can be divided into 3 main groups:

- Vibrations of various unbalanced rotating parts of the vehicle.
- Resonance vibrations of the body and frame structures caused by rotating of unbalanced parts.
- Tip-in moans of resonance vibrations from stressed engine or exhaust system mounts or driveline flexing modes.

DRIVE AXLE - RWD TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing. For definitions of listed noises or sounds, see **DRIVE AXLE - NOISE DIAGNOSIS** under **POWERTRAIN**.

DRIVE AXLE (RWD) TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Knocking or Clunking	
Differential Side Gear Clearance	Check Clearance
Worn Pinion Shaft	Replace Pinion Shaft
Axle Shaft End Play	Check End Play
Missing Gear Teeth	Check Differential/Replace Gear
Wrong Axle Backlash	Check Backlash
Misaligned Driveline	Realign Driveline
Clinking During Engagement	
Side Gear Clearance	Check Clearance
Ring and Pinion Backlash	Check Backlash
Worn/Loose Pinion Shaft	Replace Shaft/Bearing

Bad "U" Joint	Replace "U" Joint
Sticking Slip Yoke	Lube Slip Yoke
Broken Rear Axle Mount	Replace Mount
Loose Drive Shaft Flange	Check Flange
Click/Chatter On Turns	
Differential Side Gear Clearance	Check Clearance
Wrong Turn On Plates ⁽¹⁾	Replace Clutch Plates
Wrong Differential Lubricant ⁽¹⁾	Change Lubricant
Knock Or Click	
Flat Spot on Rear Wheel Bearing	Replace Wheel Bearing
Low Vibration At All Speeds	
Faulty Wheel Bearing	Replace Wheel Bearing
Faulty "U" Joint	Replace "U" Joint
Faulty Drive Shaft	Balance Drive Shaft
Faulty Companion Flange	Replace Flange
Faulty Slip Yoke Flange	Replace Flange
(1) Limited slip differential only.	

FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Grease Leaks	CV boot torn or cracked
Clicking Noise on Cornering	Damaged outer CV
Clunk Noise on Acceleration	Damaged inner CV
Vibration or Shudder on Acceleration	Sticking, damaged or worn CV Misalignment or spring height

STEERING & SUSPENSION

MANUAL STEERING GEAR TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**,

DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC MANUAL STEERING GEAR TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise in Rack and Pinion	
Rack and pinion mounting bracket loose	Tighten all mounting bolts
Lack of/or incorrect lubricant	Correct as necessary
Steering gear mounting bolts loose	Tighten all mounting bolts
Excessive Play	
Front wheel bearing improperly adjusted	See FRONT SUSPENSION article
Loose or worn steering linkage	See STEERING LINKAGE article
Loose or worn steering gear shift	See MANUAL STEERING GEAR article
Steering arm loose on gear shaft	See MANUAL STEERING GEAR article
Steering gear housing bolts loose	Tighten all mounting bolts
Steering gear adjustment too loose	See MANUAL STEERING GEAR article
Steering arms loose on knuckles	Tighten and check steering linkage
Rack and pinion mounting loose	Tighten all mounting bolts
Rack and pinion out of adjustment	See adjustment in STEERING article
Tie rod end loose	Tighten and check steering linkage
Excessive Pitman shaft-to-ball nut lash	Repair as necessary
Poor Returnability	
Lack of lubricant in ball joint or linkage	Lubricate and service systems
Binding in linkage or ball joints	See STEERING LINKAGE and SUSPENSION article
Improper front end alignment	See WHEEL ALIGNMENT article
Improper tire pressure	Inflate to proper pressure
Tie rod binding	Inflate to proper pressure
Shaft seal rubbing shaft	See STEERING COLUMN article
Excessive Vertical Motion	
Improper tire pressure	Inflate to proper pressure
Tires, wheels or rotors out of balance	Balance tires then check wheels and rotors
Worn or faulty shock absorbers	Check and replace if necessary

Loose tie rod ends or steering	Tighten or replace if necessary
Loose or worn wheel bearings	See SUSPENSION article
Steering Pulls to One Side	
Improper tire pressure	Inflate to proper pressure
Front tires are different sizes	Rotate or replace if necessary
Wheel bearings not adjusted properly	See FRONT SUSPENSION article
Bent or broken suspension components	See FRONT SUSPENSION article
Improper wheel alignment	See WHEEL ALIGNMENT article
Brakes dragging	See BRAKES article
Instability	
Low or uneven tire pressure	Inflate to proper pressure
Loose or worn wheel bearings	See FRONT SUSPENSION article
Loose or worn idler arm bushing	See FRONT SUSPENSION article
Loose or worn strut bushings	See FRONT SUSPENSION article
Incorrect front wheel alignment	See WHEEL ALIGNMENT article
Steering gear not centered	See MANUAL STEERING GEARS article
Springs or shock	Check and replace if necessary
Improper cross shaft	See MANUAL STEERING GEARS article

POWER STEERING TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC POWER STEERING TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise	
Pressure hoses touching engine parts	Adjust to proper clearance
Loose Pitman shaft	Adjust or replace if necessary
Tie rods ends or Pitman arm loose	Tighten and check system
Rack and pinion mounts loose	Tighten all mounting bolts

Free play in worm gear	See POWER STEERING GEAR article
Loose sector shaft or thrust bearing adjustment	See POWER STEERING GEAR
Free play in pot coupling	See STEERING COLUMN article
Worn shaft serrations	See STEERING COLUMN article
Growl in Steering Pump	
Excessive pressure in hoses	Restricted hoses, see POWER STEERING GEAR article
Scored pressure plates	See POWER STEERING GEAR article
Scored thrust plates or rotor	See POWER STEERING GEAR article
Extreme wear of cam ring	See POWER STEERING GEAR article
Rattle in Steering Pump	
Vanes not installed	See POWER STEERING PUMP article
Vanes sticking in rotor	See POWER STEERING PUMP article
Swish noise in Pump	
Defective flow control valve	See POWER STEERING PUMP article
Groan in Steering Pump	
Air in fluid	See POWER STEERING PUMP article
Poor pressure hose connection	Tighten and check, replace if necessary
Squawk When Turning	
Damper "O" ring on valve spool cut	See POWER STEERING PUMP article
Moan or Whine in Pump	
Pump shaft bearing scored	Replace bearing and fluid
Air in fluid or fluid level low	See POWER STEERING PUMP article
Hose or column grounded	Check and replace if necessary
Cover "O" ring missing or damaged	See POWER STEERING PUMP article
Valve cover baffle missing or damaged	See POWER STEERING PUMP article
Interference of components in pump	See POWER STEERING

	PUMP article
Loose or poor bracket alignment	Correct or replace if necessary
Hissing When Parking	
Internal leakage in steering gear	Check valved assembly first
Chirp in Steering Pump	
Loose or worn power steering belt	Adjust or replace if necessary
Buzzing When Not Steering	
Noisy pump	See POWER STEERING PUMP article
Free play in steering shaft bearing	See STEERING COLUMN article
Bearing loose on shaft serrations	See STEERING COLUMN article
Clicking Noise in Pump	
Pump slippers too long	See POWER STEERING PUMP article
Broken slipper springs	See POWER STEERING PUMP article
Excessive wear or nicked rotors	See POWER STEERING PUMP article
Damaged cam contour	See POWER STEERING PUMP article
Poor Return of Wheel	
Wheel rubbing against turn signal	See STEERING COLUMN SWITCHES article
Flange rubbing steering gear adjuster	See STEERING COLUMN article
Tight or frozen steering shaft bearing	See STEERING COLUMN article
Steering gear out of adjustment	See POWER STEERING GEAR article
Sticking or plugged spool valve	See POWER STEERING PUMP article
Improper front end alignment	See WHEEL ALIGNMENT article
Wheel bearings worn or loose	See FRONT SUSPENSION article
Ties rods or ball joints binding	Check and replace if necessary
Intermediate shaft joints binding	See STEERING COLUMN article
Kinked pressure hoses	Correct or replace if necessary
Loose housing head spanner nut	See POWER STEERING GEAR article

Damaged valve lever	See POWER STEERING GEAR article
Sector shaft adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Worm thrust bearing adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Reaction ring sticking in cylinder	See POWER STEERING GEAR article
Reaction ring sticking in housing head	See POWER STEERING GEAR article
Steering pump internal leakage	See POWER STEERING PUMP article
Steering gear-to-column misalignment	See STEERING COLUMN article
Lack of lubrication in linkage	Service front suspension
Lack of lubrication in ball joints	Service front suspension
Increased Effort When Turning Wheel Fast Foaming, Milky Power Steering Fluid, Low Fluid Level or Low Pressure	
High internal pump leakage	See POWER STEERING PUMP article
Power steering pump belt slipping	Adjust or replace if necessary
Low fluid level	Check and fill to proper level
Engine idle speed too low	Adjust to correct setting
Air in pump fluid system	See POWER STEERING PUMP article
Pump output low	See POWER STEERING PUMP article
Steering gear malfunctioning	See POWER STEERING GEAR article
Wheel Surges or Jerks	
Low fluid level	Check and fill to proper level
Loose fan belt	Adjust or replace if necessary
Insufficient pump pressure	See POWER STEERING PUMP article
Sticky flow control valve	See POWER STEERING PUMP article
Linkage hitting oil pan at full turn	Replace bent components
Kick Back or Free Play	
Air in pump fluid system	See POWER STEERING PUMP article
Worn poppet valve in steering gear	See POWER STEERING PUMP article

Excessive over center lash	See POWER STEERING GEAR article
Thrust bearing out of adjustment	See POWER STEERING GEAR article
Free play in pot coupling	See POWER STEERING PUMP article
Steering gear coupling loose on shaft	See POWER STEERING PUMP article
Steering disc mounting bolts loose	Tighten or replace if necessary
Coupling loose on worm shaft	Tighten or replace if necessary
Improper sector shaft adjustment	See POWER STEERING GEAR article
Excessive worm piston side play	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Universal joint loose	Tighten or replace if necessary
Defective rotary valve	See POWER STEERING GEAR article
No Power When Parking	
Sticking flow control valve	See POWER STEERING PUMP article
Insufficient pump pressure output	See POWER STEERING PUMP article
Excessive internal pump leakage	See POWER STEERING PUMP article
Excessive internal gear leakage	See POWER STEERING PUMP article
Flange rubs against gear adjust plug	See STEERING COLUMN article
Loose pump belt	Adjust or replace if necessary
Low fluid level	Check and add proper amount of fluid
Engine idle too low	Adjust to correct setting
Steering gear-to-column misaligned	See STEERING COLUMN article
No Power, Left Turn	
Left turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Left turn reaction seal damaged/missing	See POWER STEERING GEAR article

Cylinder head "O" ring damaged	See POWER STEERING PUMP article
No Power, Right Turns	
Column pot coupling bottomed	See STEERING COLUMN article
Right turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Right turn reaction seal damaged	See POWER STEERING GEAR article
Internal leakage through piston end plug	See POWER STEERING GEAR article
Internal leakage through side plugs	See POWER STEERING GEAR article
Lack of Effort in Turning	
Left and/or right reaction seal sticking in cylinder head	Replace, see POWER STEERING GEAR article
Wanders to One Side	
Front end alignment incorrect	See WHEEL ALIGNMENT article
Unbalanced steering gear valve	See POWER STEERING GEAR article
Low Pressure Due to Steering Pump	
Flow control valve stuck or inoperative	See POWER STEERING PUMP article
Pressure plate not flat against cam ring	See POWER STEERING PUMP article
Extreme wear of cam ring	Replace and check adjustments
Scored plate, thrust plate or rotor	See POWER STEERING PUMP article
Vanes not installed properly	See POWER STEERING PUMP article
Vanes sticking in rotor slots	See POWER STEERING PUMP article
Cracked/broken thrust or pressure plate	See POWER STEERING PUMP article

STEERING COLUMN TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC STEERING COLUMN TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Noise in Steering	
Coupling pulled apart	See STEERING COLUMNS article
Column not correctly aligned	See STEERING COLUMNS article
Broken lower joint	Replace joint
Horn contact ring not	See STEERING COLUMN article
Bearing not lubricated	See STEERING COLUMN article
Shaft snap ring not properly seated	Reseat or replace snap ring
Plastic spherical joint not lubricated	See STEERING COLUMN article
Shroud or housing loose	Tighten holding screws
Lock plate retaining ring not seated	See STEERING COLUMN article
Loose sight shield	Tighten holding screws
High Steering Shaft Effort	
Column assembly misaligned	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Tight steering universal joint	See STEERING COLUMN article
High Shift Effort	
Column is out of alignment	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Seals or bearings not lubricated	See STEERING COLUMNS article
Mounting bracket screws too long	Replace with new shorter screws
Burrs on shift tube	Remove burrs or replace tube
Lower bowl bearing assembled wrong	See STEERING COLUMN article
Shift tube bent or broken	Replace as necessary
Improper adjustment of shift levers	See STEERING COLUMN article
Improper Trans. Shifting	
Sheared shift tube joint	Replace as necessary
Sheared lower shaft lever	Replace as necessary
Improper shift lever adjustment	See STEERING COLUMN

	article
Improper gate plate adjustment	See STEERING COLUMN article
Excess Play in Column	
Instrument panel bracket bolts loose	Tighten bolts and check bracket
Broken weld nut on jacket	See STEERING COLUMN article
Instrument bracket capsule sheared	See STEERING COLUMN article
Column bracket/jacket bolts loose	Tighten bolts and check bracket
Steering Locks in Gear	
Release lever mechanism	See STEERING COLUMN article

SUSPENSION TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC SUSPENSION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Front End Noise	
Loose or worn wheel	See Wheel Bearing Adjustment in SUSPENSION
Worn shocks or shock mountings	Replace struts or strut mountings
Worn struts or strut mountings	Replace struts or strut mountings
Loose or worn lower control arm	See SUSPENSION
Loose steering gear-to-frame bolts	See STEERING
Worn control arm bushings	See SUSPENSION
Ball joints not lubricated	Lubricate ball joints & see Ball Joint Checking in SUSPENSION
Front Wheel Shake, Shimmy, or Vibration	
Tires or wheels out of balance	Check tire balance
Incorrect wheel alignment	See WHEEL ALIGNMENT
Drive shaft unbalanced	Check drive shaft balance
Loose or worn wheel bearings	See WHEEL ALIGNMENT

Loose or worn tie rod ends	See SUSPENSION
Worn upper ball joints	See Ball Joint Checking in SUSPENSION
Worn shock absorbers	Replace shock absorbers
Worn strut bushings	Replace strut bushings
Car Pulls to One Side	
Mismatched or uneven tires	Check tire condition
Broken or sagging springs	See SUSPENSION
Loose or worn strut bushings	See SUSPENSION
Improper wheel alignment	See WHEEL ALIGNMENT
Improper rear axle alignment	Check rear axle alignment
Power steering gear unbalanced	See STEERING
Front brakes dragging	See BRAKES
Abnormal Tire Wear	
Unbalanced tires	Check tire balance & rotation
Sagging or broken springs	See SUSPENSION
Incorrect front end alignment	See WHEEL ALIGNMENT
Faulty shock absorbers	Replace chock absorbers
Scuffed Tires	
Toe-In incorrect	See WHEEL ALIGNMENT
Suspension arm bent or twisted	See appropriate SUSPENSION article
Springs Bottom or Sag	
Bent or broken springs	See SUSPENSION
Leaking or worn shock absorbers	Replace shock absorbers
Frame misalignment	Check frame for damage
Spring Noises	
Loose "U" Bolts	See SUSPENSION
Loose or worn bushings	See SUSPENSION
Worn or missing interliners	See SUSPENSION
Shock Absorber Noise	
Loose shock mountings	Check & tighten mountings
Worn bushings	Replace bushings
Air in system	Bleed air from system
Undercoating on shocks	Remove undercoating
Car Leans or Sways on Corners	
Loose stabilizer bar	See SUSPENSION
Faulty shocks or mountings	Replace shocks or mountings
Broken or sagging springs	See SUSPENSION
Shock Absorbers Leaking	
Worn seals or reservoir tube crimped	See SUSPENSION

Broken Springs	
Loose "U" bolts	See SUSPENSION
Inoperative shock absorbers	Replace shock absorbers

WHEEL ALIGNMENT TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC WHEEL ALIGNMENT TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Premature Tire Wear	
Improper tire inflation	Check tire pressure
Front alignment out of tolerance	See ALIGNMENT SPECS in WHEEL ALIGNMENT section
Suspension components worn	See SUSPENSION section
Steering system components worn	See STEERING section
Improper standing height	See WHEEL ALIGNMENT
Uneven or sagging springs	See SUSPENSION section
Bent wheel	See WHEEL ALIGNMENT
Improper torsion bar adjustment	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARING ADJ. in SUSPENSION section
Worn or defective shock	Replace shock absorbers
Tires out of balance	Check tire balance
Pulls to One Side	
Improper tire inflation	Check tire pressure
Brake dragging	See BRAKE section
Mismatched tires	See WHEEL ALIGNMENT
Broken or sagging spring	See SUSPENSION section
Broken torsion bar	See SUSPENSION section
Power steering valve not centered	See STEERING section
Front alignment out of tolerance	See WHEEL ALIGNMENT section
Defective wheel bearing	See WHEEL BEARINGS in SUSPENSION section
Uneven sway bar links	See SUSPENSION section
Frame bent	Check for frame damage
Steering system bushing worn	See STEERING section

Hard Steering

Idler arm bushing too tight	See STEERING LINKAGE in STEERING section
Ball joint tight or seized	See SUSPENSION section
Steering linkage too tight	See STEERING LINKAGE in STEERING section
Power steering fluid low	Add proper amount of fluid
Power steering drive belt loose	See STEERING section
Power steering pump defective	See STEERING section
Steering gear out of adjustment	See STEERING section
Incorrect wheel alignment	See WHEEL ALIGNMENT
Damaged steering gear	See STEERING section
Damaged suspension	See SUSPENSION section
Bent steering knuckle or supports	See SUSPENSION section

Vehicle "Wanders"

Strut rod or control arm bushing worn	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARINGS in SUSPENSION section
Improper tire inflation	Check tire pressure
Stabilizer bar missing or defective	See SUSPENSION section
Wheel alignment out of tolerance	See Adjustment in WHEEL ALIGNMENT section
Broken spring	See SUSPENSION section
Defective shock absorber	Replace shock absorbers
Worn steering & suspension components	See SUSPENSION section

Front End Shimmy

Tire out of balance/round	Check tire balance
Excessive wheel runout	See WHEEL ALIGNMENT
Insufficient or improper caster	See WHEEL ALIGNMENT section
Worn suspension or steering components	See SUSPENSION section
Defective shock absorbers	Replace shock absorber
Wheel bearings worn or loose	See WHEEL BEARING ADJ. in SUSPENSION section
Power steering reaction Bracket loose	See STEERING section
Steering gear box (rack) mounting loose	See STEERING section
Steering gear adjustment loose	See STEERING section
Worn spherical joints	See SUSPENSION section

Toe-In Not Adjustable

Lower control arm bent	See SUSPENSION section
Frame bent	Check frame for damage

Camber Not Adjustable

Control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Hub & bearing not seated properly	See SUSPENSION section

DTC P0560

System Voltage

DTC P0562

System Voltage Low Voltage

DTC P0563

System Voltage High Voltage

Circuit/System Description

The vehicle control modules or sensors monitor the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 9 V or greater than 18 V for approximately 5 s.

Action Taken When the DTC Sets

- A driver information center message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the charging system.
- A possible cause of this DTC could be overcharging with a battery charger or jump starting.

Circuit/System Verification

1. Ignition OFF, measure and record the battery voltage at the battery terminals.
2. Verify the battery voltage stabilizes between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.

- **If battery voltage is less than 12.4 V or more than 12.8 V**

Refer to **Battery Inspection/Test**.

- **If battery voltage is between 12.4 and 12.8 V**

3. Engine running, headlights ON, measure and record the battery voltage at the battery terminals.
4. Verify the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.
 - **If the voltage is not at least 1 V greater than the voltage measured in step 1 or is greater than 15 V.**

Refer to **Charging System Test**.

- **If the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.**

5. Verify the appropriate control module scan tool battery voltage and ignition voltage parameters are within 1 V of the battery voltage.

- **If not within 1 V of the battery voltage**

Refer to Circuit/System Testing.

- **If within 1 V of the battery voltage**

6. All OK.

Circuit/System Testing

NOTE: Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- The control module's ground, B+, and Ignition circuit terminal IDs and connectors

NOTE: Some control module ground circuits may require up to 20 min after the ignition is turned off before achieving a resistance reading of less than 5 ohms. In most cases the readings will drop below 20 ohms within 1 min indicating the control module is going to sleep.

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate control module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between each ground circuit terminal and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate control module.
 - **If the test lamp illuminates**
4. Ignition ON.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate control module.
 - **If the test lamp illuminates**

6. Replace the control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup

DTC B1516: BATTERY CURRENT SENSO

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1516 08

Battery Current Sensor Performance - Signal Invalid

DTC B1516 66

Battery Current Sensor Incorrect Mounting

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	B1516 08	B1516 08	B1516 08	-
Signal	B1516 08	B1516 08	B1516 08	B1516 08, B1516 66
Low Reference	-	B1516 08	-	-

Circuit/System Description

The battery current sensor is a 3-wire hall effect current sensor. The body control module (BCM) supplies 5 V and ground to the battery current sensor. The battery current sensor measures the amount of current flowing to or from the battery, and supplies a pulse width modulation (PWM) signal to the BCM.

Conditions for Running the DTC

B1516 08

The BCM is awake.

B1516 66

- The BCM is awake.
- The engine is OFF.

Conditions for Setting the DTC

B1516 08

The battery current signal is less than 4% or greater than 96 % duty cycle for 2 min.

B1516 66

The battery current polarity is positive for 2 min.

Action Taken When the DTC Sets

The regulated voltage control is disabled.

Conditions for Clearing the DTC

The DTC passes when the battery current returns to the normal range for 15 s.

Diagnostic Aids

DTC B1516 08 could be set by overcharging with a battery charger or jump starting.

Circuit/System Testing

B1516 08

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B18 Battery Current Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 30 ohms between the low reference circuit terminal B and ground.
 - **If 30 ohms or greater**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 30 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal A and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If between 4.8-5.2 V**
5. Test for 4.8-5.2 V between the signal circuit terminal C and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K9 Body Control Module.
- **If greater than 5.2 V**
- 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
- 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
- **If between 4.8-5.2 V**
- 6. Test or replace the B18 Battery Current Sensor.

B1516 66

1. Verify that the B18 Battery Current Sensor is installed securely around the negative battery cable, with the tape tab pointing away from the negative terminal on the C1 Battery.
 - **If the B18 Battery Current Sensor is not installed correctly**
 - Remove and reinstall the B18 Battery Current Sensor properly.
 - **If the B18 Battery Current Sensor is installed correctly**
2. Replace the B18 Battery Current Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Battery Positive and Negative Cable Replacement (LL0), Battery Positive and Negative Cable Replacement (LFM)**
- **Control Module References** for BCM replacement, programming and setup.

DTC B151A: BATTERY CAPACITY PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B151A 58

Battery Capacity Performance

Circuit/System Description

The body control module (BCM) monitors the battery voltage level during an engine crank event to detect a low battery voltage condition.

Conditions for Running the DTC

The vehicle is ON

Conditions for Setting the DTC

A minimum crank battery voltage is less than the minimum crank battery voltage threshold for 16 consecutive crank events.

Action Taken When the DTC Sets

A driver information center message is displayed.

Conditions for Clearing the DTC

The DTC will clear if the minimum crank voltage is greater than the minimum crank voltage threshold during a crank event.

Circuit/System Verification

1. Verify DTC P0621 or P0622 is not set.

- If DTC P0621 or P0622 is set

Refer to DTC P0621, or DTC P0622

- If DTC P0621 or P0622 is not set

2. Perform the Battery Inspection/Test.

DTC B1527: PARASITIC LOAD

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1527 00

Parasitic Load

Circuit/System Description

The body control module (BCM) monitors the state of charge of the electrical system.

Conditions for Running the DTC

The ignition is in Accessory or Run mode.

Conditions for Setting the DTC

The state of charge at ignition ON is 30% lower than when the engine was running and battery drain is more than 2 A.

Action Taken When the DTC Sets

There is no battery telltale illuminated or DIC message displayed.

Conditions for Clearing the DTC

- The DTC will clear if the fault does not return after 50 consecutive ignition cycles.
- The DTC will clear when run state of charge is greater than or equal to 80%.

DTC P0615, P0616, OR P0617: STARTER RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0615

Starter Relay Control Circuit

DTC P0616

Starter Relay Control Circuit Low Voltage

DTC P0617

Starter Relay Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P0616	P0615	P0617	-
Ground	-	P0615	-	-

Circuit/System Description

When the ignition switch is placed in the START position, a discrete signal is supplied to the body control module (BCM) notifying it that the ignition is in the START position. The BCM then sends a message to the engine control module (ECM) that crank has been requested. The ECM then verifies that the clutch pedal is depressed or the transmission is in Park/Neutral. If it is, the ECM then supplies 12 V to the control circuit of the starter relay. When this occurs, battery voltage is supplied through the switch of the starter relay to the starter solenoid.

Conditions for Running the DTC

- The ignition is in the START position.
- The system voltage is between 9.5-18 V.

Conditions for Setting the DTC

The ECM detects improper voltage on the control circuit of the starter relay.

Action Taken When the DTC Sets

DTC P0615, P0616, and P0617 are type C DTCs.

Conditions for Clearing the DTC

DTC P0615, P0616, and P0617 are type C DTCs.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the KR27 starter relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 86 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is OK**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance,
 3. Test for infinite resistance between the control circuit terminal 87 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the KR27 starter relay.

- **If the test lamp illuminates**
- 5. Connect a test lamp between the control circuit terminal 85 and the ground circuit terminal 86.
- 6. Verify the test lamp turns ON and OFF when commanding the starter relay ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K20 engine control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 engine control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K20 engine control module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.
 - **If the test lamp turns ON and OFF**
- 7. Ignition ON, connect a 30 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
- 8. Verify the M64 starter motor is activated.
 - **If the M64 starter motor does not activate**
 1. Ignition OFF, disconnect the harness connector at the M64 starter motor.
 2. Test for infinite resistance between the control circuit terminal X2 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M64 starter motor.
 - **If the M64 starter motor activates**
- 9. Test or replace the KR27 starter relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR27 starter relay.
2. Test for 60-180 ohms between terminals 85 and 86.
 - **If less than 60 or greater than 180 ohms**

Replace the relay.

- **If between 60-180 ohms**

3. Test for infinite resistance between the terminals listed below:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87
- **If less than infinite resistance**

Replace the relay.

- **If infinite resistance**

4. Install a 20 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.
5. Test for less than 2 ohms between terminals 30 and 87
- **If 2 ohms or greater**

Replace the relay.

- **If less than 2 ohms**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Control Module References** for ECM replacement, programming, and setup.

DTC P0621: GENERATOR L-TERMINAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0621

Generator L-Terminal Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	-	P0621	-	-
Control - L Terminal	P0621	P0621	P0621	-
Signal - F Terminal	P0622	P0622	P0622	P0622

Circuit/System Description

The engine control module (ECM) uses the generator turn on control circuit to control the load of the generator on the engine. A high side driver in the ECM applies a duty cycled voltage to the voltage regulator. The duty cycle controls the voltage regulator to turn the field circuit on and off. The ECM monitors the state of the generator turn on control circuit. The ECM should detect low voltage on the generator turn on control circuit when the ignition is ON and the engine is off, or when the charging system malfunctions. With the engine running, the ECM should detect on the generator turn on control circuit, a high voltage when the duty cycle voltage is commanded high, and a low voltage when the duty cycle voltage is commanded low.

Conditions for Running the DTC

- Ignition ON, engine OFF (Prior to Ignition ON, the ignition must have been OFF for at least 5 s).
- The engine is running for the run test.

Conditions for Setting the DTC

- Ignition ON, engine OFF - The ECM detects greater than 3.5 V on the generator control circuit for 5 s.
- Engine running - The ECM detects a low voltage for 15 s on the generator control circuit when the duty cycle voltage is commanded high.
- Engine running - The ECM detects a high voltage for 15 s on the generator control circuit when the duty cycle voltage is commanded low.

Action Taken When the DTC Sets

DTC P0621 is a type C DTC.

Conditions for Clearing the DTC

- Ignition ON, engine OFF- Low voltage.
- Engine running - A control signal duty cycle is detected.

Circuit/System Verification

1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
2. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**
3. All OK.

Circuit/System Testing

1. Verify a test lamp illuminates between the G13 Generator B+ circuit terminal A X2, B X2 or 1 X2, and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Remove the test lamp and disconnect the B+ cable at the G13 Generator.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**
- 1. Remove the test lamp, disconnect the battery negative cable, and disconnect the G13 Generator B+ cable.
- 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
- **If the test lamp illuminates**
- 2. Disconnect the X1 harness connector at the G13 Generator, ignition ON.
- 3. Test for 1 V or greater between the control circuit terminal 1 X1 and ground.
 - **If less than 1 V**
 - 1. Ignition OFF, disconnect the harness connectors at the K20 Engine Control Module.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If greater than 2 ohms, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If 1V or greater**
 - 4. Ignition OFF, disconnect the harness connectors at the K20 Engine Control Module, Ignition ON.
 - 5. Test for less than 1 V between the G13 Generator control circuit terminal 1 X1 and ground.
 - **If greater than 1 V**
 - Repair the short to voltage on the circuit.
 - **If 1V or less**
 - 6. Test or replace the G13 Generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Replacement**
- **Control Module References** for engine control module replacement, programming, and setup

DTC P0622: GENERATOR F-TERMINAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0622

Generator F-Terminal Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	-	P0621	-	-
Control - L Terminal	P0621	P0621	P0621	-
Signal - F Terminal	P0622	P0622	P0622	P0622

Circuit/System Description

The engine control module (ECM) uses the generator field duty cycle signal circuit, or F-terminal circuit, to monitor the duty cycle of the generator. The generator field duty cycle signal circuit connects to high side of the field windings in the generator. A pulse width modulated (PWM) high side driver in the voltage regulator turns the field windings on and off. The ECM uses the PWM signal input to determine the generator load on the engine. This allows the ECM to adjust the idle speed to compensate for high electrical loads. The ECM monitors the status of the generator field duty cycle signal circuit. When the ignition is ON and the engine is off, the ECM should detect a duty cycle near 0%. When the engine is running, the duty cycle should be between 5-99%.

Conditions for Running the DTC

- Ignition ON, engine OFF (Prior to Ignition ON, the ignition must have been OFF for at least 5 s)
- Engine running at less than 3, 000 RPM

Conditions for Setting the DTC

- DTC P0621 is not set
- Ignition ON, engine OFF (Prior to Ignition ON, the ignition must have been OFF for at least 5 s), the ECM detects a PWM signal that is greater than 65% for 5 s
- Engine running at less than 3, 000 RPM-The ECM detects a PWM signal that is less than 5% for 30 s

Action Taken When the DTC Sets

DTC P0622 is a type C DTC

Conditions for Clearing the DTC

- Ignition ON, Engine OFF- Low / no PWM signal detected
- Engine running - A 5-90% duty cycle is detected

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: Do not have a battery charger connected during the generator testing.

1. Engine running.
2. Verify the scan tool Engine Control Module Generator F-Terminal Signal parameter is between 5-90%.
 - **If not between 5-90%**

Refer to Circuit/System Testing.

- **If between 5-90%**
3. Verify the scan tool Generator F-Terminal Signal parameter changes when commanding the headlamps ON and OFF.
 - **If the parameter does not change**

Refer to Circuit/System Testing.

- **If the parameter changes**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Verify a test lamp illuminates between the G13 Generator B+ circuit terminal A X2, B X2 or 1 X2, and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Remove the test lamp and disconnect the B+ cable at the G13 Generator.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Remove the test lamp, disconnect the battery negative cable, and disconnect the G13 Generator B+ cable.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - **If the test lamp illuminates**
2. Disconnect the X1 harness connector at the G13 Generator, engine running.
3. Verify the scan tool Engine Control Module Generator F-Terminal Signal parameter is less than 5%.
 - **If 5% or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If less than 5%**
4. Install a 3 A fused jumper wire between the signal circuit terminal 2 and B+, engine running.
5. Verify the scan tool Engine Control Module Generator F-Terminal Signal parameter is greater than 95%.
 - **If 95% or less**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit
 - If less than 2 ohms, replace the K20 Engine Control Module.
- **If greater than 95%**
- 6. Test or replace the G13 Generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Replacement**
- **Control Module References** for engine control module replacement, programming, and setup

SYMPTOMS - ENGINE ELECTRICAL

NOTE: The following steps must be completed before using the symptom tables.

- Perform **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
- Review the system descriptions and operations in order to familiarize yourself with the system functions. Refer to one of the following system operations:
 - **Battery Description and Operation**
 - **Charging System Description and Operation**
 - **Electrical Power Management Description and Operation**
 - **Starting System Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the starting and charging systems. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Battery Inspection/Test
- Battery Electrical Drain/Parasitic Load Test
- Charging System Test
- Generator Noise Diagnosis
- Starter Solenoid Does Not Click
- Starter Solenoid Clicks, Engine Does Not Crank
- Engine Cranks Slowly
- Starter Noise Diagnosis

BATTERY INSPECTION/TEST

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Aids

NOTE: For Warranty repairs -

You must use regionally required battery test equipment for warranty repairs.

For accurate test results the battery must be disconnected from the vehicle and the equipment connected directly to the battery posts. When setting up the equipment, select "Out of Vehicle" and then the correct battery type (Flooded or AGM) and rated CCA (both from the battery label) must be entered.

- **Failure to obtain the correct connections during the test may result in a failed test on a good battery.**
- **Use the Out of Vehicle test (both batteries disconnected with test equipment connected directly to the post) test for each battery when testing a vehicle with dual batteries.**

Follow these instructions in order to avoid an incorrect diagnosis because of connections:

- If testing the vehicle with the battery cables still connected, wiggle the battery tester clips on the terminal. This may cut through any coating or through any oxidation that may be present on the terminal.
- If correct connections to the battery terminals in the vehicle are in doubt, perform the following steps:
 1. Disconnect the negative battery cable.
 2. Disconnect the positive battery cable.
 3. Follow the instructions for testing a removed battery.
- If the tester displays a REPLACE BATTERY or BAD CELL-REPLACE result for a battery tested in the

vehicle with the battery cables connected, perform the following steps:

1. Disconnect the negative battery cable.
2. Disconnect the positive battery cable.

NOTE: Always write the test code displayed by the tester on the repair order for any warranty purposes. The number is a unique code that describes the test data for a particular battery at a particular time. The test code may occasionally repeat when you retest the same battery. More often, each test will result in a different code. Use the test code from the second, or Out of Vehicle test.

3. Follow the instructions for testing a removed battery.
4. Replace the battery only if the second test shows a REPLACE BATTERY or BAD CELL-REPLACE result.

Use the test code from the second test for any warranty purposes.

Special Tools

EL 50313 Battery Tester

Circuit/System Testing

WARNING: Unless directed otherwise, the ignition and start switch must be in the OFF or LOCK position, and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

For Vehicles equipped with OnStar® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar® module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStar® Back-Up Battery system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

1. Verify the C1 or C1B Battery case is not cracked, broken, or damaged, which may be indicated by battery acid leakage.
 - **If there is any apparent damage**

Replace the C1 or C1B Battery.
 - **If there is no damage**
2. Verify the cold cranking amperage and amperage hour rating of the C1 or C1B Battery. Refer to the manufacturer specifications on the battery label.
 - **If the C1 or C1B Battery does not meet specifications**

Replace the C1 or C1B Battery.
 - **If the C1 or C1B Battery meets specifications**
3. Verify that the battery cables are clean and tight. The battery terminal bolts should be torqued as specified in **Fastener Tightening Specifications**.
 - **If the battery cables need to be cleaned or tightened**

Clean as required and tighten as specified.

- **If the battery cables are clean and tight**

4. Install the battery tester and follow directions supplied by the tester.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Battery Replacement

BATTERY CHARGING

Special Tools

EL 50313 Battery Tester

For equivalent regional tools, refer to **Special Tools**.

Diagnostic Aids

- For best results, use an automatic taper-rate battery charger with a voltage capability of 16 V.
- The charging area should be well ventilated.
- Do not charge a battery that appears to be frozen. Allow the battery to warm to room temperature and test it using the EL 50313 before charging.

Battery State of Charge

NOTE: **Using voltage to determine the batteries state of charge is only accurate after the battery has been at rest for 24 hours. This is enough time for the acid in each cell to equalize. If the battery has been charged or discharged in the past 24 hours, the battery state of charge will only be an estimate.**

The maintenance-free batteries state of charge is estimated by reading the voltage of the battery across the battery terminals. Because the voltage is affected by current flow into or out of the battery, the engine must be stopped and all electrical loads turned OFF, including parasitic loads, when checking the voltage. The voltage can also be affected if the battery has just been charged or discharged, so it is important to consider what has happened to the battery in the time just before testing. Use the following procedure to determine the battery's state of charge:

1. Be sure all electrical loads are turned OFF.
2. Determine whether the battery has been used in a vehicle or charged within the past 12 hours.
 - If the answer is no, the terminal voltage will be stabilized and no action is necessary before reading the voltage. Skip to step 3.
 - If the answer is yes, terminal voltage will not be stabilized and you should wait 12 hours since the last time the battery was used.
3. Estimate the battery temperature by determining the average temperature to which the battery has been

exposed for the past 12 hours.

NOTE: The table is accurate to 10 % only after the battery has been at rest for 12 hours.

4. Measure the battery voltage at the battery terminals. Refer to the following table to determine the state of charge according to the estimated battery temperature:

Battery Voltage	% Charge at 0°C (32°F)	% Charge at 25°C (75°F)
12.75 V	100%	100%
12.7 V	100%	90%
12.6 V	90%	75%
12.45 V	75%	65%
12.2 V	65%	45%
12.0 V	40%	20%

Use the state of charge information as follows:

- A battery with a state of charge that is below 65% must always be recharged before returning it to service or continuing storage.
- A battery with a state of charge that is 65% or greater is generally considered to be charged enough in order to be returned to normal service or in order to continue storage. However, if the battery is being used in slow traffic or with short drive times, or if the temperature is very hot or very cold, the battery should be fully charged, to at least 90%, before returning it to service or continuing storage.

Charging Time Required

The time required to charge a battery will vary depending upon the following factors:

- The battery charger capacity-The higher the charger amperage, the less time it will take to charge the battery.
- The state of charge of the battery-A completely discharged battery requires more than twice as much charging time as a half charged battery. In a discharged battery with a voltage below 11 V, the battery has a very high internal resistance and may only accept a very low current at first. Later, as the charging current causes the acid content to increase in the electrolyte, the charging current will increase. Extremely discharged batteries may not activate the reversed voltage protection in some chargers. Refer to the manufacturer's instructions for operating this circuitry.
- The temperature of the battery-The colder the battery is, the more time it takes to recharge the battery. The charging current accepted by a cold battery is very low at first. As the battery warms, the charging current will increase.

Charging Procedure

CAUTION: Turn OFF the ignition when connecting or disconnecting the battery cables, the battery charger or the jumper cables. Failure to do so may

damage the ECM/PCM or other electronic components.

CAUTION: Refer to Fastener Caution .

When charging side-terminal batteries with the battery cables connected, connect the charger to the positive cable bolt and to a ground located away from the battery. When charging side-terminal batteries with the battery cables disconnected, install the battery side terminal adapters and connect the charger to the adapters.

Tighten

Tighten the battery side terminal adapters to 15 (11 lb ft).

Use the following procedure to charge the battery:

1. Turn OFF the charger.
2. Ensure that all of the battery terminal connections are clean and tight.
3. Connect the charger positive lead to the battery positive terminal on the battery or the remote jumper stud underhood.

CAUTION: Do not connect the negative charger lead to the housings of other vehicle electrical accessories or equipment. The action of the battery charger may damage such equipment.

4. Connect the negative charger lead to a solid engine ground or to a ground stud in the engine compartment that is connected directly to the battery negative terminal, but away from the battery. If the negative battery cable is disconnected and a terminal adapter is being used, connect directly to the adapter.
5. Turn ON the charger and set to the highest setting for normal charging.
6. Inspect the battery every half hour after starting the battery charger.
 - Charge the battery until the taper-rate charger indicates that the battery is fully charged.
 - Estimate the battery temperature by feeling the side of the battery. If it feels hot to the touch or its temperature is over 45°C (125°F), discontinue charging and allow the battery to cool before resuming charging.
7. After charging, test the battery. Refer to Battery Inspection/Test.

BATTERY ELECTRICAL DRAIN/PARASITIC LOAD TEST

12 V Battery

The following procedure is for the 12 V battery only.

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

Components most likely to cause a parasitic draw on the vehicles battery are switches, relays, and control modules. After the ignition is turned OFF the control modules will begin to go to sleep (shut OFF). All control modules do not go to sleep at the same time, some may take up to 30 minutes or longer after turning the ignition off before going to sleep. Others such as the ON Star and keyless entry control modules may periodically wake up then go back to sleep. These are all normal conditions.

Diagnostic Aids

- Rule out any possible aftermarket equipment causing an unacceptable parasitic current drain. Aftermarket accessories installed into the courtesy lamp circuit can cause the inadvertent power timer in the body control module (BCM) to keep resetting. This may cause the BCM to remain awake and cause a current drain on the battery.
- Rule out customer driving habits such as regular short trips that do not allow enough time to properly charge the battery. Refer to **Battery Description and Operation**.
- Verify that the battery and charging system are in proper working order. Refer to **Battery Charging**, and **Charging System Test**.
- A battery discharging for no apparent reason while the vehicle is parked can be caused by an intermittent draw, such as a module waking up, or a continuous draw, such as a dome light or stuck relay.
- Some systems and modules such as OnStar®, and regulated voltage control, if equipped, are designed to wake up, perform a task, and go back asleep at regular intervals. Refer to **Body Control System Description and Operation** for the system or modules description and operation.
- An engine off natural vacuum evaporative test can occur if the engine control module (ECM) determines the drive cycle has met the appropriate criteria immediately after key off. The ECM will stay awake and the vent solenoid will stay energized for as long as 45 min. The typical current draw for this is about 1 A.
- Digital OnStar Generation 6 and later vehicle communication interface module do not "wake up" every 10 minutes for the first 48 hours as the Generation 5 and prior. Generation 6 and later vehicle communication interface module current draw is very low, less than 40 mA, so the OnStar system is left in that state for up to the first 48 h. Parasitic draw of up to 40 mA with an occasional spike as high as 80 mA through the vehicle communication interface module for the first 48 hours is normal.
- Some automatic climate control systems can remain in a semi awake state for up to three hours, actual draw amounts vary by vehicle platform but are typically not greater than 50 mA.
- An extremely low mA current level is consumed by the body control module for monitoring purposes, actual system wake up only occurs when the fobs for the vehicle are used. When other devices on the same remote keyless entry operating frequency are activated, such as the 4 tire pressure monitoring sensors and other vehicle Fobs in the vicinity, the body control module will have a 100 mA spike. These spikes are normal and occur too briefly to have a significant effect on battery drain. Competing signals may cause remote keyless entry performance issues such as jamming but should not cause excessive battery draw.
- If an excessive current draw is not present during initial testing, continue periodic testing over a 1-2 hour period to see if the current draw increases and stays above an unacceptable level.

NOTE: The battery specification listed below is a generic specification. Refer to the label on the original battery when testing the battery.

- The battery run down time will vary depending on the batteries reserve capacity. If the reserve capacity is higher, then the battery run down time may be longer. If the reserve capacity is lower, then the battery run down time may be shorter. The graph below indicates roughly how many days a 690 cold cranking amperage battery with a 110 min. reserve capacity starting at 80 percent state of charge will last with a constant current draw until it reaches 50 percent state of charge. Differences in battery reserve capacity and temperature will affect the results.

Current Drain	Days
25 mA	33
50 mA	16.5
75 mA	11
100 mA	8.25
250 mA	3.3
500 mA	1.65
750 mA	1
1 A	0.8
2 A	0.4

EL 38758 Parasitic Draw Test Switch

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

NOTE:

- Most vehicle systems will go to sleep within 30 min, but it can take up to 2 hours before all systems power down allowing the parasitic draw test to pass. An occasional increase in the parasitic draw is normal as long as it returns within 1 s.
- Closing the door latches/ajar switch while leaving the doors open is recommended, this allows the vehicle systems to perform in a "doors closed" mode while allowing vehicle interior access that may be needed to complete the diagnostic steps.
- Locking doors will arm the vehicle content theft deterrent system if equipped. Failure to arm the system may cause a theft system fault to not be present during testing.
- There are many things that can prevent the vehicle from completely going to sleep and passing the parasitic draw test. Make sure all the conditions listed below are met before performing the parasitic current draw test.
 - Ignition OFF
 - Key out of the ignition switch - when not equipped with keyless access and start
 - Retained Accessory Power OFF - open and close the driver door after ignition OFF
 - Scan tool not communicating with a vehicle control module - in some cases it may need to be disconnected from the DLC
 - All access doors closed
 - Head lamps OFF - auto head lamps disabled
 - Any delay lighting OFF
 - If equipped with an under hood lamp disable it
 - HVAC after blow OFF
 - Any accessory that can work with ignition OFF inactive or OFF
 - Wait up to 2 min or longer, after all other listed conditions are met

Using an Inductive Pickup Probe

1. Connect an inductive pickup probe to the negative battery cable that can read down to 1 mA.
2. Ignition OFF, as the vehicle systems shut down test for less than 30 mA of parasitic current drain.
 - If greater than the specified range, refer to Circuit/System Testing.

Using the EL 38758 Parasitic Draw Test Switch

WARNING: Refer to **Battery Disconnect Warning** .

CAUTION: When a fused jumper wire or digital multimeter is connected to the test switch terminals, always turn the test switch ON before opening any access door, turning the ignition on, or turning any accessory on. This is to prevent damaging the jumper wire or digital multimeter fuse.

NOTE: The switch knob on the EL 38758 switch is marked ON and OFF. When the switch knob is in the ON position, the circuit is closed and electrical current will pass through the switch. When the switch knob is in the OFF position, the circuit is open and electrical current will not pass through the switch.

1. Ignition OFF, disconnect the battery negative cable from the battery. Refer to **Battery Negative Cable Disconnection and Connection**.
2. Turn the **EL 38758** switch knob to the OFF position.
3. Install the male end of the **EL 38758** switch to the battery ground terminal.
4. Install the battery negative cable to the female end of the **EL 38758** switch.
5. Turn the **EL 38758** switch knob to the ON position.
6. Road test the vehicle and activate all of the accessories such as the radio and air conditioning.
7. Ignition OFF, connect a 10 A fused jumper wire to the test switch tool terminals.
8. Turn the **EL 38758** switch knob to the OFF position. The current now flows through the jumper wire.
9. Check the fuse in the jumper wire. The fuse should be OK.
 - Failed: If the jumper wire fuse is blown, refer to Circuit/System Testing.
 - Passed
10. Turn the **EL 38758** switch knob to the ON position. Remove the fused jumper wire.
11. Connect a DMM set to the 10 A DC scale between the test switch tool terminals.
12. Turn the **EL 38758** switch knob to the OFF position. The current now flows through the DMM.
13. As the vehicle systems shut down test for less than 30 mA of parasitic current drain.
 - If greater than the specified range, refer to Circuit/System Testing.

Circuit/System Testing

- NOTE:**
- Removing or installing a fuse, relay, or connector, to determine the area causing high parasitic draw may wake up control modules. You must wait for the control modules to go back to sleep before retesting. It is best to install any removed or disconnected components after the diagnosis is completed.
 - Fuses for power mode master components such as the BCM should be removed last to avoid misdiagnosis.
 - If a scan tool is connected to the DLC, either disconnect it or subtract the

scan tool current draw from the DMM reading to get the actual vehicle parasitic current draw.

If the vehicle has an unacceptable amount of parasitic current draw, remove each fuse one at a time until the current draw falls to an acceptable level. A drop of more than 10-20 mA, when disabling a single system or circuit, is an indication of an overly high current draw that could be causing the battery drain. Refer to **Power Distribution Schematics** to diagnose exactly which circuit of the suspect system is causing the high parasitic drain. The following is a list of common components that could cause a high current draw:

- Stuck switch
- Stuck relay
- Control module

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup

CHARGING SYSTEM TEST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	-	P0621	-	-
Control - L Terminal	P0621	P0621	P0621	-
Signal - F Terminal	P0622	P0622	P0622	P0622

Circuit/System Description

The engine control module (ECM) uses the generator turn ON control circuit to control the load of the generator on the engine. A high side driver in the ECM applies a duty cycled voltage to the voltage regulator. The duty cycle controls the voltage regulator to turn the field circuit ON and OFF. The ECM monitors the state of the generator turn ON control circuit. The ECM should detect low voltage on the generator turn on control circuit when the ignition is ON and the engine is OFF, or when the charging system malfunctions. With the engine running, the ECM should detect high voltage when the duty cycle voltage is commanded high and a low voltage when the duty cycle voltage is commanded low on the generator turn on control circuit.

The engine control module (ECM) uses the generator field duty cycle signal circuit, or F-terminal circuit, to

monitor the duty cycle of the generator. The generator field duty cycle signal circuit connects to high side of the field windings in the generator. A pulse width modulated (PWM) high side driver in the voltage regulator turns the field windings on and off. The ECM uses the PWM signal input to determine the generator load on the engine. This allows the ECM to adjust the idle speed to compensate for high electrical loads. The ECM monitors the status of the generator field duty cycle signal circuit. When the ignition is ON and the engine is off, the ECM should detect a duty cycle near 0%. When the engine is running, the duty cycle should be between 5-99%.

Circuit/System Verification

NOTE: **Do not have a battery charger connected during the generator testing.**

1. Ignition ON.
2. Verify that no G13 Generator or B18 Battery Current Sensor DTCs are set that would cause a charging system concern.
 - **If DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are set**
3. Verify the scan tool Body Control Module Battery Voltage parameter is 12 V or greater.
 - **If less than 12 V**

Refer to **Battery Inspection/Test**.

- **If 12 V or greater**
- 4. Engine running, all accessories OFF.
- 5. Verify the scan tool Body Control Module Battery Voltage parameter continually increases when controlling the Body Control Module Generator Regulator Setpoint from 10% to 80% with a scan tool. It may take up to 10 s for the battery voltage to stabilize between each setpoint change.
 - **If the battery voltage does not continually increase**

Refer to Circuit/System Testing.

- **If the battery voltage continually increases**
- 6. All OK.

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Ignition OFF.
2. Test for less than 2 ohms between the G13 Generator housing and C1 Battery negative terminal.
 - **If 6.5 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 6.4 ohms**
- 3. Verify a test lamp illuminates between the G13 Generator B+ circuit terminal A X2, B X2 or 1 X2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Remove the test lamp and disconnect the B+ cable at the G13 Generator.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Remove the test lamp, disconnect the C1 Battery negative cable, and disconnect the G13 Generator B+ cable.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - **If the test lamp illuminates**
- 4. Test or replace the G13 Generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Generator Replacement

GENERATOR NOISE DIAGNOSIS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

Noise from a generator may be due to electrical or mechanical noise. Electrical noise or magnetic whine usually varies with the electrical load placed on the generator and is a normal operating characteristic of all generators. When diagnosing a noisy generator, it is important to remember that loose or misaligned components around the generator may transmit the noise into the passenger compartment and that replacing the generator may not solve the problem.

Circuit/System Testing

1. Start the engine. Verify the noise can be heard. Compare the concern to a similar vehicle.
2. Perform a charging system test. Verify that the generator is charging properly.
3. Inspect the generator, generator mounting, wiring harness, heater hoses, A/C lines, or other accessory equipment that may be misrouted or be the cause of noise being transmitted into the passenger compartment.
4. Ignition OFF, remove the engine drive belt.
5. Verify the generator, A/C compressor, water pump pulley, power steering pump, idler pulley, and tensioner pulley spin freely.

- **If any of the pulleys do not spin freely**

Replace the affected component.

- **If all belt driven components spin freely**

6. Start the engine. Operate the engine for no longer than 30-40 seconds.
 7. Verify that the noise goes away.
- **If the noise is still present**

The generator is not the cause of the noise. Refer to **Symptoms - Engine Mechanical** .

- **If noise is no longer present**

8. Inspect for worn accessory drive components or abnormalities such as severe cracking, bumps, or missing areas in the accessory drive belt and/or misalignment of system components

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

STARTER SOLENOID DOES NOT CLICK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+ (relay terminal 30)	1	1	-	-
Relay Coil Control (relay terminal 85)	P0615	P0615	2	-
Starter Control (relay terminal 87)	1	1	2	-
Ground (relay terminal 86)	-	P0615	-	-
1. Starter Solenoid Does Not Click 2. Cranks All The Time				

Circuit/System Description

When the ignition mode switch is placed in the START position, a discrete signal is supplied to the body control module (BCM) notifying it that the ignition is in the START position. The BCM then sends a serial data message to the engine control module (ECM) that crank has been requested. The ECM then verifies that the clutch is fully depressed or the automatic transmission is in Park/Neutral. If it is, the ECM then supplies 12 V to the control circuit of the starter relay. When this occurs, battery voltage is supplied through the switch of the starter relay to the starter solenoid.

Circuit/System Verification

Automatic Transmission

1. Ignition ON.
2. Verify that no ignition, KR27 Starter Relay, brake pedal position sensor, immobilizer, or transmission DTCs are set that would cause the ECM to disable engine starting.
 - **If DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**
 - **If no DTCs are set**
3. Verify the scan tool 5 V Ignition Switch parameter is Crank Request while attempting to start the vehicle.
 - **If parameter does not display Crank Request**

Refer to **Vehicle Will Not Change Power Mode**
 - **If parameter displays Crank Request**
4. Verify the scan tool TCM Internal Mode Switch parameter displays Park when in park.
 - **If the TCM Internal Mode Switch parameter does not indicate Park .**

Refer to **Park/Neutral Position Switch Inspection**
 - **If the TCM Internal Mode Switch parameter displays Park**
5. Verify the scan tool ECM Crankshaft Position Active Counter parameter is not incrementing.
 - **If the counter increments**

Replace the B26 Crankshaft Position Sensor.
 - **If the counter does not increment**
6. Verify the engine cranks in park or neutral.

- **If the KR27 Starter Relay does not click or the engine does not crank**

Refer to Circuit/System Testing.

- **If the engine cranks**

7. All OK

Manual Transmission

1. Ignition ON.
2. Verify that no ignition, KR27 Starter Relay, clutch pedal position sensor, brake pedal position sensor, or immobilizer DTCs are set that would cause the ECM to disable engine starting.

- **If DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

- **If no DTCs are set**

3. Verify the scan tool 5 V Ignition Switch parameter is Crank Request while attempting to start the vehicle.

- **If parameter does not display Crank Request**

Refer to **Power Mode Mismatch**

4. Ignition ON.
5. Verify the scan tool Clutch Pedal Starter Inhibit Switch parameter changes between On and Off while depressing and releasing the clutch pedal.

- **If the Clutch Pedal Starter Inhibit parameter does not change**

Refer to **Clutch Pedal Position Sensor Learn**

- **If the clutch pedal starter inhibit parameter does change**

6. Fully depress clutch pedal.
7. Attempt to start the vehicle.
8. Verify the scan tool ECM Crankshaft Position Active Counter parameter is not incrementing.

- **If the counter increments**

Replace the B26 Crankshaft Position Sensor.

- **If the counter does not increment**

9. Verify the crank relay does click and the engine begins cranking.

- **If the KR27 Starter Relay does not click or the engine does not begin cranking**

Refer to Circuit/System Testing.

- **If the KR27 Starter Relay does click and the engine does begin cranking**

10. All OK

Circuit/System Testing

1. Ignition ON.
2. Verify the scan tool ECM Ignition 1 Signal parameter is greater than 10 V.
 - **If 10 V or less**
 1. Ignition OFF, disconnect the harness connector at the K20 engine control module.
 2. Test for infinite resistance between the ignition voltage circuits and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 engine control module.
 - **If greater than 10 V**
3. Ignition OFF, disconnect the KR27 starter relay, ignition ON.
4. Verify that a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance,
 3. Disconnect X2 harness connector at the M64 starter motor.
 4. Test for infinite resistance between the control circuit terminal 87 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M64 starter motor.
 - **If the test lamp illuminates**
5. Ensure the parking brake is applied and the automatic transmission is in PARK or the manual transmission is in neutral. Momentarily install a 30 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
6. Verify the M64 starter motor is activated.
 - **If the M64 starter motor does not activate**
 1. Disconnect the X1 harness connector at the M64 starter motor.
 2. Test for less than 2 ohms in the control circuit end to end.

- If greater the 2 ohms, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the M64 starter motor.

- **If the M64 starter motor activates**

7. Test or replace the KR27 starter relay.

Component Testing

Relay Test

1. Ignition OFF. Disconnect the KR27 Starter Relay.
2. Test for 60-180 ohms between terminals 85 and 86.
 - **If less than 60 or greater than 180 ohms**

Replace the relay.

- **If between 60-180 ohms**

3. Test for infinite resistance between the terminals listed below:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87
 - **If less than infinite resistance**

Replace the relay.

- **If infinite resistance**

4. Install a 20 A fused jumper wire between relay terminal 85 and B+.
5. Install a jumper wire between relay terminal 86 and ground.
6. Test for less than 2 ohms between terminals 30 and 87.
 - **If 2 ohms or greater**

Replace the relay.

- **If less than 2 ohms**

7. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Crankshaft Position Sensor Replacement** for the 1.0L, 1.19L, 1.2L engines
- **Control Module References** for ECM replacement, programming, and setup.

STARTER SOLENOID CLICKS, ENGINE DOES NOT CRANK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

Circuit/System Testing

1. Ignition OFF, measure and record the battery voltage at the C1 terminals.
2. Verify the measured voltage is between 12-15 V.
 - If voltage is less than 12 V or greater than 15 V

Refer to **Battery Inspection/Test**.

- If voltage is between 12-15V
3. Remove the drive belts. Refer to **Water Pump and Generator Belt Replacement**
 4. Verify the crankshaft rotates rotate the crankshaft by hand using the appropriate tools.
 - If the crankshaft does not rotate

Refer to **Engine Will Not Crank - Crankshaft Will Not Rotate**

- **If the crankshaft rotates**

5. Verify the engine does not crank when attempting to start the vehicle.

- **If the engine cranks**

Inspect the engine and belt drive system for mechanical binding, seized engine, or seized generator.

- **If the engine does not crank**

6. Verify that a test lamp illuminates between the M64 starter motor B+ terminal 1 X2 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.

2. Test for less than 2 ohms in the B+ circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.

2. Test for greater than 100 ohms between the B+ circuit and ground.

- If 100 ohms or less, repair the short to ground on the circuit.

- If greater than 100 ohms, replace the M64 starter motor.

- **If the test lamp illuminates**

7. Test for less than 0.5 V between the positive battery cable and M64 Starter Motor B+ terminal 1 X2 with the ignition in the START position.

- **If 0.5 V or greater**

Replace the positive battery cable.

- **If less than 0.5 V**

8. Test for less than 0.5 V between the negative battery cable and the M64 starter motor case with the ignition in the START position.

- **If 0.5 V or greater**

Replace the negative battery cable.

- **less than 0.5 V**

9. Replace the M64 starter motor.

STARTER NOISE DIAGNOSIS

Circuit/System Testing

1. Remove the flywheel inspection cover.

2. Inspect the flywheel for the following:

- Loose flywheel bolts
- Chipped gear teeth
- Missing gear teeth
- Bent flywheel
- If not within specifications, secure the flywheel bolts or replace the flywheel.
- If all inspections were within specification, replace the starter motor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- Refer to **Fastener Tightening Specifications (LL0)** , **Fastener Tightening Specifications (LFM)** .
- Refer to **Engine Flywheel Replacement** .
- Refer to **Starter Replacement**.

REPAIR INSTRUCTIONS

BATTERY NEGATIVE CABLE DISCONNECTION AND CONNECTION

Disconnect Procedure

Fig. 3: Negative Battery Cable And Cable Nut
Courtesy of GENERAL MOTORS COMPANY

1. Ensure that all lamps and accessories are turned off. Turn the ignition OFF and remove the ignition key.
2. Loosen the negative battery cable nut.
3. Remove the negative battery cable from the battery.

Connect Procedure

Fig. 4: Negative Battery Cable And Cable Nut
Courtesy of GENERAL MOTORS COMPANY

1. Install the negative battery cable to the battery.

CAUTION: Refer to Fastener Caution .

2. Fasten the negative battery cable nut and tighten to 12 (9 lb ft).
3. Insert the ignition key and turn the ignition to the ON position.
4. Program all of the customer radio station presets and set the radio clock to the current time.

BATTERY CURRENT SENSOR REPLACEMENT

Removal Procedure

1. Remove the battery. Refer to **Battery Replacement**.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
3. Remove the battery tray. Refer to **Battery Tray Replacement**.

Fig. 5: Body Harness Connector

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the body harness connector (1) from the battery current sensor (2).
5. Remove the battery negative ground cable fastener (3) and the battery negative cable (4) from the frame rail.

Fig. 6: Battery Current Sensor

Courtesy of GENERAL MOTORS COMPANY

NOTE: Note the orientation of the battery current sensor when removing.

6. Remove the battery current sensor (2) from the battery negative cable (1).

Installation Procedure

Fig. 7: Battery Current Sensor

Courtesy of GENERAL MOTORS COMPANY

1. Install the battery current sensor (2) onto the battery negative cable (1) as shown.

Fig. 8: Body Harness Connector

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the battery negative cable (2) to the frame rail and tighten the battery negative ground cable fastener (3) to 9 (80 lb in).
3. Connect the body harness connector (1) to the battery current sensor (2).
4. Install the battery tray. Refer to Battery Tray Replacement.
5. Install the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .
6. Install the battery. Refer to Battery Replacement.

BATTERY POSITIVE AND NEGATIVE CABLE REPLACEMENT (LL0)

Removal Procedure

1. Open the hood.
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .

Fig. 9: Body Wiring Master Harness Connector
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the body wiring master harness connector (1) from the battery positive cable junction block.
5. Remove the battery. Refer to **Battery Replacement**.

Fig. 10: Positive Battery Cable Nut
Courtesy of GENERAL MOTORS COMPANY

6. Remove the junction block cover.
7. Remove the relay box cover.
8. Remove the positive battery cable nut (1) from the junction block.
9. Remove the positive battery cable nut (2) from the relay box.
10. Remove the positive battery cable (3) from the junction block and relay box.
11. Remove the battery tray. Refer to **Battery Tray Replacement**.

Fig. 11: Battery Negative Cable Frame Ground Bolt
Courtesy of GENERAL MOTORS COMPANY

12. Remove the battery negative cable frame ground bolt (1).
13. Remove the battery negative cable (2).
14. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .
15. Remove the exhaust front pipe assembly. Refer to **Exhaust Front Pipe Replacement (LL0)** .

Fig. 12: Starter Solenoid B (+) Nut
Courtesy of GENERAL MOTORS COMPANY

16. Remove the starter solenoid B (+) nut (1).
17. Remove the generator B (+) nut (2).
18. Remove the engine harness and battery cable male ground bolt (3).
19. Remove the retainer (4).
20. Remove the battery positive and negative cable (5) from the vehicle.

Installation Procedure

Fig. 13: Starter Solenoid B (+) Nut
Courtesy of GENERAL MOTORS COMPANY

1. Install the battery positive and negative cable (5) to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the engine harness and battery cable male ground bolt (3) and tighten to 40 (30 lb ft).
3. Install the generator B (+) nut (2) and tighten to 11 (8 lb in).
4. Install the starter solenoid B (+) nut (1) and tighten to 12 (9 lb in).
5. Install the retainer (4).
6. Install the exhaust front pipe assembly. Refer to Exhaust Front Pipe Replacement (LL0) .
7. Lower the vehicle.

Fig. 14: Battery Negative Cable Frame Ground Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Install the battery negative cable (2).
9. Install the battery negative cable frame ground bolt (1) and tighten to 12 (9 lb in).
10. Remove the battery tray. Refer to **Battery Tray Replacement**.

Fig. 15: Positive Battery Cable Nut
Courtesy of GENERAL MOTORS COMPANY

11. Install the positive battery cable (3) to the junction block and relay box.
12. Install the positive battery cable nut (2) and tighten to 12 (9 lb in).
13. Install the positive battery cable nut (1) and tighten to 12 (9 lb in).
14. Install the relay box cover.
15. Install the junction block cover.
16. Install the battery. Refer to **Battery Replacement**.

Fig. 16: Body Wiring Master Harness Connector
Courtesy of GENERAL MOTORS COMPANY

17. Connect the body wiring master harness connector (1) to the battery positive cable junction block.
18. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
19. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection.**
20. Close the hood.

BATTERY POSITIVE AND NEGATIVE CABLE REPLACEMENT (LFM)

Removal Procedure

1. Open the hood.
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection.**
3. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

16. Remove the starter solenoid B (+) nut (1).
17. Remove the generator B (+) nut (2).
18. Remove the engine harness and battery cable male ground bolt (3).
19. Remove the retainer (4).
20. Remove the battery positive and negative cable (5) from the vehicle.

Installation Procedure

Fig. 21: Starter Solenoid B (+) Nut
Courtesy of GENERAL MOTORS COMPANY

1. Install the battery positive and negative cable (5) to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the engine harness and battery cable male ground bolt (3) and tighten to 40 (30 lb ft).
3. Install the generator B (+) nut (2) and tighten to 11 (8 lb ft).
4. Install the starter solenoid B (+) nut (1) and tighten to 12 (9 lb ft).
5. Install the retainer (4).
6. Install the exhaust pipe assembly. Refer to **Exhaust Pipe Replacement (LFM)** .
7. Lower the vehicle.

Fig. 22: Battery Negative Cable Frame Ground Bolt

DESCRIPTION AND OPERATION

BATTERY DESCRIPTION AND OPERATION

WARNING: Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:

- Always shield your eyes and avoid leaning over the battery whenever possible.
- Do not expose the battery to open flames or sparks.
- Do not allow the battery electrolyte to contact the eyes or the skin. Flush immediately and thoroughly any contacted areas with water and get medical help.
- Follow each step of the jump starting procedure in order.
- Treat both the booster and the discharged batteries carefully when using the jumper cables.

Batteries that are no longer wanted must be disposed of by an approved battery recycler and must never be thrown in the trash or sent to a landfill.

Batteries that are not part of the vehicle itself, not the battery under the hood, must only be transported on public streets for business purposes via approved hazardous material transportation procedures.

Battery storage, charging and testing facilities in repair shops must meet various requirements for ventilation, safety equipment, material segregation, etc.

The maintenance free battery is standard. There are no vent plugs in the cover. The battery is completely sealed except for 2 small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

The battery has 3 functions as a major source of energy:

- Engine cranking
- Voltage stabilizer
- Alternate source of energy with generator overload

Battery Low Start Vehicle Message

The body control module (BCM) monitors battery positive voltage to determine battery state of charge. If one or more of the BCM battery positive voltage terminals measure less than approximately 11.6V compared to the BCM ground circuits, this message will display and four chimes may sound. Start the vehicle immediately. If the vehicle is not started and the battery continues to discharge, the climate controls, heated seats, and audio systems will shut off and the vehicle may require a jump start. These systems will function again after the vehicle is started.

Battery Ratings

A battery has 2 ratings:

- Cold cranking amperage
- Amperage hours

When a battery is replaced use a battery with similar ratings. See battery specification label on the original battery.

Amperage Hours

The amperage hour rating tells you how much amperage is available when discharged evenly over a 20 hour period. The amperage hour rating is cumulative, so in order to know how many constant amperage the battery will output for 20 h, you have to divide the amperage hour rating by 20. Example: If a battery has an amperage hour rating of 74, dividing by 20 = 3.75. Such a battery can carry a 3.75 A load for 20 hours before dropping to 10.5 V. (10.5 V is the fully discharged level, at which point the battery needs to be recharged.) A battery with an amperage hour rating of 55 will carry a 2.75 A load for 20 hours before dropping to 10.5 V.

Cold Cranking Amperage

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 seconds at -18°C (0°F) while maintaining at least 7.2 V. See battery label for the cold cranking amperage rating of this battery.

CHARGING SYSTEM DESCRIPTION AND OPERATION

Electrical Power Management Overview

The electrical power management system is designed to monitor and control the charging system and send diagnostic messages to alert the driver of possible problems with the battery and generator. This electrical power management system primarily utilizes existing on-board computer capability to maximize the effectiveness of the generator, to manage the load, improve battery state-of-charge and life, and minimize the system's impact on fuel economy. The electrical power management system performs 3 functions:

- It monitors the battery voltage and estimates the battery condition.
- It takes corrective actions by boosting idle speeds, and adjusting the regulated voltage.

- It performs diagnostics and driver notification.

The battery condition is estimated during ignition-off and during ignition-on. During ignition-off the state-of-charge of the battery is determined by measuring the open-circuit voltage. The state-of-charge is a function of the acid concentration and the internal resistance of the battery, and is estimated by reading the battery open circuit voltage when the battery has been at rest for several hours.

The state-of-charge can be used as a diagnostic tool to tell the customer or the dealer the condition of the battery. Throughout ignition-on, the algorithm continuously estimates state-of-charge based on adjusted net amp hours, battery capacity, initial state-of-charge, and temperature.

While running, the battery degree of discharge is primarily determined by a battery current sensor, which is integrated to obtain net amp hours.

In addition, the electrical power management function is designed to perform regulated voltage control to improve battery state-of-charge, battery life, and fuel economy. This is accomplished by using knowledge of the battery state-of-charge and temperature to set the charging voltage to an optimum battery voltage level for recharging without detriment to battery life.

The Charging System Description and Operation is divided into 3 sections. The first section describes the charging system components and their integration into the electrical power management. The second section describes charging system operation. The third section describes the instrument panel cluster operation of the charge indicator, driver information center messages, and voltmeter operation.

Charging System Components

Generator

The generator is a serviceable component. If there is a diagnosed failure of the generator it must be replaced as an assembly. The engine drive belt drives the generator. When the rotor is spun it induces an alternating current (AC) into the stator windings. The AC voltage is then sent through a series of diodes for rectification. The rectified voltage has been converted into a direct current (DC) for use by the vehicles electrical system to maintain electrical loads and the battery charge. The voltage regulator integral to the generator controls the output of the generator. It is not serviceable. The voltage regulator controls the amount of current provided to the rotor. If the generator has field control circuit failure, the generator defaults to an output voltage of 13.8 V.

Body Control Module (BCM)

The body control module (BCM) is a GMLAN device. It communicates with the engine control module (ECM) and the instrument panel cluster for electrical power management (electrical power management) operation. The BCM determines the output of the generator and sends the information to the ECM for control of the generator turn on signal circuit. It monitors the generator field duty cycle signal circuit information sent from the ECM for control of the generator. It monitors a battery current sensor, the battery positive voltage circuit, and estimated battery temperature to determine battery state of charge. The BCM performs idle boost.

Battery Current Sensor

The battery current sensor is a serviceable component that is connected to either the negative or positive battery cable at the battery. The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the BCM. It creates a 5-volt pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes.

Engine Control Module (ECM)

When the engine is running, the generator turn-on signal is sent to the generator from the ECM, turning on the regulator. The generator's voltage regulator controls current to the rotor, thereby controlling the output voltage. The rotor current is proportional to the electrical pulse width supplied by the regulator. When the engine is started, the regulator senses generator rotation by detecting AC voltage at the stator through an internal wire. Once the engine is running, the regulator varies the field current by controlling the pulse width. This regulates the generator output voltage for proper battery charging and electrical system operation. The generator field duty terminal is connected internally to the voltage regulator and externally to the ECM. When the voltage regulator detects a charging system problem, it grounds this circuit to signal the ECM that a problem exists. The ECM monitors the generator field duty cycle signal circuit, and receives control decisions based on information from the BCM.

Instrument Panel Cluster

The instrument panel cluster provides the customer notification in case a concern with the charging system. There are 2 means of notification, a charge indicator and a driver information center message of SERVICE BATTERY CHARGING SYSTEM if equipped.

Charging System Block Diagram

Fig. 32: Charging System Block Diagram

DB	Serial Data - GMLAN Low Speed
P16	P16 Instrument Cluster
K20	K20 Engine Control Module
G13	G13 Generator
C1	C1 Battery
B18	B18 Battery Current Sensor
K9	K9 Body Control Module

Charging System Operation

The purpose of the charging system is to maintain the battery charge and vehicle loads. There are 6 modes of operation and they include:

- Battery Sulfation Mode

- Charge Mode
- Fuel Economy Mode
- Headlamp Mode
- Start Up Mode
- Voltage Reduction Mode

The engine control module (ECM) controls the generator through the generator turn ON signal circuit. The ECM monitors the generator performance through the generator field duty cycle signal circuit. The signal is a pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes. The following table shows the commanded duty cycle and output voltage of the generator:

Commanded Duty Cycle	Generator Output Voltage
10%	11 V
20%	11.56 V
30%	12.12 V
40%	12.68 V
50%	13.25 V
60%	13.81 V
70%	14.37 V
80%	14.94 V
90%	15.5 V

The generator provides a feedback signal of the generator voltage output through the generator field duty cycle signal circuit to the ECM. This information is sent to the body control module (BCM). The signal is PWM signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-99 percent. Between 0-5 percent and 100 percent are for diagnostic purposes.

Battery Sulfation Mode

The BCM will enter this mode when the interpreted generator output voltage is less than 13.2 V for 45 minutes. When this condition exists the BCM will enter Charge Mode for 2-3 minutes. The BCM will then determine which mode to enter depending on voltage requirements.

Charge Mode

The BCM will enter Charge Mode when ever one of the following conditions are met.

- The wipers are ON for more than 3 seconds.
- GMLAN (Climate Control Voltage Boost Mode Request) is true, as sensed by the HVAC control head. High speed cooling fan, rear defogger and HVAC high speed blower operation can cause the BCM to enter the Charge Mode.
- The estimated battery temperature is less than 0°C (32°F).
- Battery State of Charge is less than 80 percent.

- Vehicle speed is greater than 145 km/h (90 mph)
- Current sensor fault exists.
- System voltage was determined to be below 12.56 V

When any one of these conditions is met, the system will set targeted generator output voltage to a charging voltage between 13.9-15.5 V, depending on the battery state of charge and estimated battery temperature.

Fuel Economy Mode

The BCM will enter Fuel Economy Mode when the estimated battery temperature is at least 0°C (32°F) but less than or equal to 80°C (176°F), the calculated battery current is less than 15 amperes and greater than -8 amperes, and the battery state-of-charge is greater than or equal to 80 percent. Its targeted generator output voltage is the open circuit voltage of the battery and can be between 12.5-13.1 V. The BCM will exit this mode and enter Charge Mode when any of the conditions described above are present.

Headlamp Mode

The BCM will enter Headlamp Mode when ever the headlamps are ON (high or low beams). Voltage will be regulated between 13.9-14.5 V.

Start Up Mode

When the engine is started the BCM sets a targeted generator output voltage of 14.5 V for 30 seconds.

Voltage Reduction Mode

The BCM will enter Voltage Reduction Mode when the calculated ambient air temperature is above 0°C (32°F). The calculated battery current is less than 1 ampere and greater than -7 amperes, and the generator field duty cycle is less than 99 percent. Its targeted generator output voltage is 12.9 V. The BCM will exit this mode once the criteria are met for Charge Mode.

Instrument Panel Cluster Operation

Charge Indicator Operation

The instrument panel cluster illuminates the charge indicator and displays a warning message in the driver information center if equipped, when the one or more of the following occurs:

- The engine control module (ECM) detects that the generator output is less than 11 V or greater than 16 V. The instrument panel cluster receives a GMLAN message from the ECM requesting illumination.
- The instrument panel cluster determines that the system voltage is less than 11 V or greater than 16 V for more than 30 seconds. The instrument panel cluster receives a GMLAN message from the body control module (BCM) indicating there is a system voltage range concern.
- The instrument panel cluster performs the displays test at the start of each ignition cycle. The indicator illuminates for approximately 3 seconds.

Display Message: BATTERY NOT CHARGING SERVICE CHARGING SYSTEM or SERVICE

BATTERY CHARGING SYSTEM

The BCM and the ECM will send a serial data message to the driver information center for the BATTERY NOT CHARGING SERVICE CHARGING SYSTEM or SERVICE BATTERY CHARGING SYSTEM message to be displayed. It is commanded ON when a charging system DTC is a current DTC. The message is turned OFF when the conditions for clearing the DTC have been met.

ELECTRICAL POWER MANAGEMENT DESCRIPTION AND OPERATION

Electrical Power Management

The electrical power management is used to monitor and control the charging system and alert the driver of possible problems within the charging system. The electrical power management system makes the most efficient use of the generator output, improves the battery state-of-charge, extends battery life, and manages system electrical loads.

The load shed operation is a means of reducing electrical loads during a low voltage or low battery state-of-charge condition.

The idle boost operation is a means of improving generator performance during a low voltage or low battery state-of-charge condition.

Each electrical power management function, either idle boost or load shed, is discrete. No two functions are active at the same time. Idle boost is activated in incremental steps, idle boost 1 must be active before idle boost 2 can be active. The criteria used by the body control module (BCM) to regulate electrical power management are outlined below:

Load Shed 3 End	-	Greater Than 12.6 V	Battery has a net loss of less than 15 Ah	Clear Load Shed 3

STARTING SYSTEM DESCRIPTION AND OPERATION

The starter motors are non-repairable starter motors. They have pole pieces that are arranged around the armature. Both solenoid windings are energized. The pull-in winding circuit is completed to the ground through the starter motor. The windings work together magnetically to pull and hold in the plunger. The plunger moves the shift lever. This action causes the starter drive assembly to rotate on the armature shaft spline as it engages with the flywheel ring gear on the engine. Moving at the same time, the plunger also closes the solenoid switch contacts in the starter solenoid. Full battery voltage is applied directly to the starter motor and it cranks the engine.

As soon as the solenoid switch contacts close, current stops flowing thorough the pull-in winding because battery voltage is applied to both ends of the windings. The hold-in winding remains energized. Its magnetic field is strong enough to hold the plunger, shift lever, starter drive assembly, and solenoid switch contacts in place to continue cranking the engine. When the engine starts, pinion overrun protects the armature from excessive speed until the switch is opened.

When the ignition switch is released from the START position, the START relay opens and battery voltage is removed from the starter solenoid S terminal. Current flows from the motor contacts through both windings to the ground at the end of the hold-in winding. However, the direction of the current flow through the pull-in winding is now opposite the direction of the current flow when the winding was first energized.

The magnetic fields of the pull-in and hold-in windings now oppose one another. This action of the windings, along with the help of the return spring, causes the starter drive assembly to disengage and the solenoid switch contacts to open simultaneously. As soon as the contacts open, the starter circuit is turned off.

Circuit Description (Key Start)

When the ignition switch is placed in the Start position, a discrete signal is supplied to the body control module (BCM) notifying it that the ignition is in the Start position. The BCM then sends a message to the engine control module (ECM) notifying it that CRANK has been requested. The ECM verifies that the transmission is in Park or Neutral. If it is, the ECM then supplies 12 V to the control circuit of the crank relay. When this

occurs, battery positive voltage is supplied through the switch side of the crank relay to the S terminal of the starter solenoid.

Signal	B3006 02	B3006 04	B3006 01	-
Ground	-	B3006 04	-	-

Circuit/System Description

The body control module (BCM) applies B+ to the hood ajar signal circuit and monitors the voltage to determine the position of the hood. When the hood is closed, the switch is open and voltage remains high. When the hood is open, the switch is closed and the voltage is pulled low.

Conditions for Running the DTC

The BCM continuously monitors for this DTC

Conditions for Setting the DTC

B3006 01

The BCM detects that the hood ajar switch signal circuit is shorted to battery.

B3006 02

The BCM detects that the hood ajar switch signal circuit is shorted to ground.

B3006 04

The BCM detects that the hood ajar switch signal circuit is open.

Action Taken When the DTC Sets

- The hood ajar switch input will be ignored as a content theft deterrent trigger.
- Remote vehicle start will be disabled.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction free ignition cycles.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Hood Ajar Switch parameter is Open when the hood is open and Closed when the hood is closed.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B55 Hood Ajar Switch. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 10 ohms between the ground circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for greater than 11.5 V between the signal circuit terminal 1 and ground.
 - **If 11.5 V or less**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If Infinite resistance.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 11.5 V**
5. Ignition OFF, disconnect the X4 and X7 harness connector at the K9 Body Control Module. Ignition ON.
6. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
7. Test or replace the B55 Hood Ajar Switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B55 Hood Ajar Switch.
2. Test for 2738-3350 ohms between the signal terminal 1 and the signal terminal 2 with the hood latch in the CLOSED position.
 - **If not between 2738-3350 ohms**

Replace the B55 Hood Ajar Switch.
 - **If between 2738-3350 ohms**
3. Test for 658-806 ohms between the signal terminal 2 and the ground terminal 3 with the hood latch in the CLOSED position.
 - **If not between 658-806 ohms**

Replace the B55 Hood Ajar Switch.

- **If between 658-806 ohms**

4. Test for 2080-2545 ohms between the signal terminal 1 and the ground terminal 3 with the hood latch in the CLOSED position.

- **If not between 2080-2545 ohms**

Replace the B55 Hood Ajar Switch.

- **If between 2080-2545 ohms**

5. Test for 2738-3350 ohms between the signal terminal 1 and the signal terminal 2 with the hood latch in the OPEN position.

- **If not between 2738-3350 ohms**

Replace the B55 Hood Ajar Switch.

- **If between 2738-3350 ohms**

6. Test for 2080-2545 ohms between the signal terminal 2 and the ground terminal 3 with the hood latch in the OPEN position.

- **If not between 2080-2545 ohms**

Replace the B55 Hood Ajar Switch.

- **If between 2080-2545 ohms**

7. Test for 658-806 ohms between the signal terminal 1 and the ground terminal 3 with the hood latch in the OPEN position.

- **If not between 658-806 ohms**

Replace the B55 Hood Ajar Switch.

- **If between 658-806 ohms**

8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Hood Primary and Secondary Latch Replacement**
- **Control Module References** for Body Control Module replacement, programming and setup

SYMPTOMS - BOLTED EXTERIOR BODY PANELS AND CLOSURES

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Hood Ajar Indicator Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Hood Ajar Indicator/Message Malfunction** in order to diagnose the symptom.

HOOD AJAR INDICATOR/MESSAGE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3006 01

Hood Ajar Circuit Short to Battery

DTC B3006 02

Hood Ajar Circuit Short to Ground

DTC B3006 04

Hood Ajar Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B3006 02	B3006 04	B3006 01	-
Ground	-	B3006 04	-	-

Circuit/System Description

The body control module (BCM) applies B+ to the hood ajar signal circuit and monitors the voltage to determine the position of the hood. When the hood is closed, the switch is open and voltage remains high. When the hood is open, the switch is closed and the voltage is pulled low.

Conditions for Running the DTC

The BCM continuously monitors for this DTC

Conditions for Setting the DTC

B3006 01

The BCM detects that the hood ajar switch signal circuit is shorted to battery.

B3006 02

The BCM detects that the hood ajar switch signal circuit is shorted to ground.

B3006 04

The BCM detects that the hood ajar switch signal circuit is open.

Action Taken When the DTC Sets

- The hood ajar switch input will be ignored as a content theft deterrent trigger.
- Remote vehicle start will be disabled.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction free ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Hood Ajar Switch parameter is Open when the hood is open and Closed when the hood is closed.
 - **If the parameter does not change**

Refer to Circuit/System Testing.

- **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B55 Hood Ajar Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for greater than 11.5 V between the signal circuit terminal 1 and ground.
 - **If 11.5 V or less**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If Infinite resistance.
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 11.5 V**
5. Ignition OFF, disconnect the X4 and X7 harness connector at the K9 Body Control Module. Ignition ON.
6. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
7. Test or replace the B55 Hood Ajar Switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B55 Hood Ajar Switch.
2. Test for 2738-3350 ohms between the signal terminal 1 and the signal terminal 2 with the hood latch in the CLOSED position.
 - **If not between 2738-3350 ohms**

Replace the B55 Hood Ajar Switch.
 - **If between 2738-3350 ohms**
3. Test for 658-806 ohms between the signal terminal 2 and the ground terminal 3 with the hood latch in the CLOSED position.
 - **If not between 658-806 ohms**

Replace the B55 Hood Ajar Switch.
 - **If between 658-806 ohms**
4. Test for 2080-2545 ohms between the signal terminal 1 and the ground terminal 3 with the hood latch in the CLOSED position.
 - **If not between 2080-2545 ohms**

Replace the B55 Hood Ajar Switch.
 - **If between 2080-2545 ohms**
5. Test for 2738-3350 ohms between the signal terminal 1 and the signal terminal 2 with the hood latch in

the OPEN position.

- **If not between 2738-3350 ohms**

Replace the B55 Hood Ajar Switch.

- **If between 2738-3350 ohms**

6. Test for 2080-2545 ohms between the signal terminal 2 and the ground terminal 3 with the hood latch in the OPEN position.

- **If not between 2080-2545 ohms**

Replace the B55 Hood Ajar Switch.

- **If between 2080-2545 ohms**

7. Test for 658-806 ohms between the signal terminal 1 and the ground terminal 3 with the hood latch in the OPEN position.

- **If not between 658-806 ohms**

Replace the B55 Hood Ajar Switch.

- **If between 658-806 ohms**

8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Hood Primary and Secondary Latch Replacement**
- **Control Module References** for Body Control Module replacement, programming and setup

REPAIR INSTRUCTIONS

HOOD PRIMARY LATCH RELEASE CABLE REPLACEMENT

Fig. 2: Hood Primary Latch Release Cable
Courtesy of GENERAL MOTORS COMPANY

Hood Primary Latch Release Cable Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove hood primary latch release cable handle. Refer to <u>Hood Primary Latch Release Cable Handle Replacement</u> .	
2. Remove air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> .	
1	Hood Primary Latch Release Cable Procedure To release the hood primary latch release cable, unhook from hood primary and secondary latch.

REAR SIDE DOOR CHECK REPLACEMENT

Fig. 3: Rear Side Door Check
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Check Replacement

Callout	Component Name
Preliminary Procedure Remove rear side door trim panel. Refer to Rear Side Door Trim Panel Replacement .	
1	Rear Side Door Check Link Bolt CAUTION: Refer to Fastener Caution . TIP: Place the door in the full open position. Tighten 28 N.m (21 lb ft)
2	Rear Side Door Check Bolt Procedure Remove the water deflector. Tighten 5.5 N.m (49 lb in)
3	Rear Side Door Check

FRONT SIDE DOOR ADJUSTMENT

Fig. 4: Front Side Door

Courtesy of GENERAL MOTORS COMPANY

Front Side Door Adjustment

Callout	Component Name
Preliminary Procedure	
Remove the front wheelhouse liner. Refer to Front Wheelhouse Liner Replacement .	
1	Front Side Door to Roof CAUTION: Refer to Fastener Caution . Procedure 1. Loosen the 4 front side door hinge bolts to adjust the front side door. 2. Adjust the front side door in order to obtain an even gap between the front side door and the roof, the rear door, the rocker panel and the front fender and so that the front side door is flush with the roof, the rear door, the rocker panel and the front fender. Adjustment: • Front side door to roof (a) 4.0 mm $\pm$ 1.0 mm (0.16 in $\pm$ 0.04 in) • Front side door to rear door (b) 3.5 mm $\pm$ 0.75 mm (0.14 in $\pm$ 0.03 in) • Front side door to rocker panel (c) 5.0 mm $\pm$ 1.0 mm (0.20 in $\pm$ 0.04 in)

- Front side door to front fender (d) $3.5 \text{ mm} \pm 0.75 \text{ mm}$ ($0.14 \text{ in} \pm 0.03 \text{ in}$)

Tighten

28 N.m (21 lb ft)

FRONT SIDE DOOR REPLACEMENT

Fig. 5: Front Side Door & Mounting Components
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> .	
1	Front Side Door Check Link Bolt CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Remove the water deflector. 2. Disconnect the door electrical connector.

	- Support the door before removing the hinge bolts. - With the aid of an assistant, remove the door. Tighten 28 N.m (21 lb ft)
2	Front Side Door Lower Hinge Bolt (Qty: 2) Tighten 28 N.m (21 lb ft)
3	Front Side Door Upper Hinge Bolt (Qty: 2) Tighten 28 N.m (21 lb ft)
4	Front Side Door Procedure - Transfer all of the internal components. - Adjust the front side door as needed. Refer to <u>Front Side Door Adjustment</u>.

REAR SIDE DOOR ADJUSTMENT

Fig. 6: Rear Side Door
Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Adjustment

Callout	Component Name
1	Rear Side Door CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Loosen the 4 rear door hinge bolts to adjust the rear door. 2. Adjust the rear door in order to obtain an even gap between the rear door and the roof, the quarter outer panel, the rocker panel and the front side door and so that the rear door is flush with the roof, the quarter outer panel, the rocker panel and the front side door. Adjustment: • Rear side door to roof (a) 4.0 mm $\pm$ 1.0 mm (0.16 in $\pm$ 0.04 in) • Rear side door to quarter outer panel (b) 3.5 mm $\pm$ 0.75 mm (0.14 in $\pm$ 0.03 in) • Rear side door to rocker panel (c) 5.0 mm $\pm$ 1.0 mm (0.20 in $\pm$ 0.04 in) • Rear side door to front side door (d) 3.5 mm $\pm$ 0.75 mm (0.14 in $\pm$ 0.03 in) Tighten 28 N.m (21 lb ft)

REAR SIDE DOOR REPLACEMENT

Fig. 7: Rear Side Door
Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Replacement

Callout	Component Name
Preliminary Procedure Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> .	
1	Rear Side Door Check Link Bolt CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Remove the water deflector. 2. Disconnect the door electrical connector. 3. Support the door before removing the hinge bolts. 4. With the aid of an assistant, remove the door. Tighten 28 N.m (21 lb ft)
2	Rear Side Door Lower Hinge Bolt (Qty: 2) Tighten

	28 N.m (21 lb ft)
3	Rear Side Door Upper Hinge Bolt (Qty: 2) Tighten 28 N.m (21 lb ft)
4	Rear Side Door Procedure 1. Transfer all of the internal components. 2. Adjust the rear side door as needed. Refer to <u>Rear Side Door Adjustment</u> .

FRONT FENDER REPLACEMENT

Fig. 8: Front Fender

Courtesy of GENERAL MOTORS COMPANY

Front Fender Replacement

Callout	Component Name
Preliminary Procedure	
1.	Remove the front bumper fascia. Refer to <u>Front Bumper Fascia Replacement</u> .
2.	Remove the headlamp. Refer to <u>Headlamp Replacement</u> .
3.	Remove front bumper fascia guide. Refer to <u>Front Bumper Fascia Guide Replacement</u> .
4.	Remove the wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> .

5. Remove the air inlet grille panel. Refer to <u>Air Inlet Grille Panel Replacement</u> .	
1	Front Fender Bolt (Qty: 6) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 7.5 N.m (66 lb in)
2	Front Fender

LIFTGATE ADJUSTMENT

Fig. 9: Liftgate
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Adjustment

Callout	Component Name
	Liftgate CAUTION: Refer to <u>Fastener Caution</u> . Procedure

1. Loosen the 4 liftgate hinge bolts to adjust the liftgate.
2. Adjust the liftgate in order to obtain an even gap between the liftgate and the roof, the quarter outer panel, the tail lamp and rear bumper fascia and so that the liftgate is flush with the roof, the quarter outer panel, the tail lamp and rear bumper fascia.

Adjustment:

1

- Liftgate to roof (a) $5.5 \text{ mm} \pm 1.0 \text{ mm}$ ($0.22 \text{ in} \pm 0.04 \text{ in}$)
- Liftgate to quarter outer panel (b) $4.0 \text{ mm} \pm 1.0 \text{ mm}$ ($0.16 \text{ in} \pm 0.04 \text{ in}$)
- Liftgate to tail lamp (c) $3.5 \text{ mm} \pm 1.5 \text{ mm}$ ($0.14 \text{ in} \pm 0.06 \text{ in}$)
- Liftgate to rear bumper fascia (d) $5.1 \text{ mm} \pm 1.0 \text{ mm}$ ($0.20 \text{ in} \pm 0.04 \text{ in}$)

Tighten
28 N.m (15 lb ft)

LIFTGATE REPLACEMENT

Fig. 10: Liftgate Hinge Bolt
Courtesy of GENERAL MOTORS COMPANY

Liftgate Replacement

Callout	Component Name

WARNING:

When a lift gate hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

Preliminary Procedure Release the liftgate strut from the liftgate. Refer to Liftgate Strut Replacement.

1	Liftgate Hinge Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Disconnect the electrical connector. 2. Pull the liftgate wiring grommet, the connectors and the rear washer hose out of the body. 3. Mark the location of the liftgate hinges to the body with a grease pencil. Tighten 20 N.m (15 lb ft)
2	Liftgate Procedure 1. Transfer components as necessary. 2. Adjust liftgate as needed. Refer to <u>Liftgate Adjustment</u>.

FRONT SIDE DOOR WIRING HARNESS REPLACEMENT

Fig. 11: Front Side Door Wiring Harness
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Wiring Harness Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door inner panel trim. Refer to Front Side Door Trim Panel Replacement .	
1	Front Side Door Wiring Harness WARNING: Unless directed otherwise, the ignition and start switch must be in the OFF or LOCK position and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components. For Vehicles equipped with OnStar® (UE1) with Back Up Battery: The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar® module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStar® Back-Up Battery system and will

discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

Procedure

1. Disconnect the battery.
2. Remove the water deflector.
3. Disconnect electrical connectors as needed.

LIFTGATE WIRING HARNESS REPLACEMENT

Fig. 12: Liftgate Wiring Harness

Courtesy of GENERAL MOTORS COMPANY

Liftgate Wiring Harness Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the liftgate trim panel. Refer to <u>Liftgate Trim Panel Replacement</u> . 2. Remove the rear window. Refer to <u>Rear Window Replacement</u> .	
	Liftgate Wiring Harness
	WARNING:

1

Unless directed otherwise, the ignition and start switch must be in the OFF or LOCK position and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

For Vehicles equipped with OnStar® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar® module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStar® Back-Up Battery system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

Procedure

1. Disconnect the battery.
2. Disconnect electrical connectors as needed.

REAR SIDE DOOR WIRING HARNESS REPLACEMENT

Fig. 13: Rear Side Door Wiring Harness
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Wiring Harness Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear side door inner panel trim. Refer to <u>Rear Side Door Trim Panel Replacement</u> .	
1	Rear Side Door Wiring Harness WARNING: Unless directed otherwise, the ignition and start switch must be in the OFF or LOCK position and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components. For Vehicles equipped with OnStar® (UE1) with Back Up Battery: The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar® module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStar® Back-Up Battery system and will

discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

Procedure

1. Disconnect the battery.
2. Remove the water deflector.
3. Disconnect electrical connectors as needed.

HOOD PRIMARY LATCH RELEASE CABLE HANDLE REPLACEMENT

Fig. 14: Hood Primary Latch Release Cable Handle
Courtesy of GENERAL MOTORS COMPANY

Hood Primary Latch Release Cable Handle Replacement

Callout	Component Name
1	Hood Primary Latch Release Cable Handle Procedure 1. Pull down the hood primary latch release cable handle. 2. To release the handle, pull down the cable and unhook from the handle.

FRONT SIDE DOOR UPPER HINGE AND LOWER HINGE REPLACEMENT

Fig. 15: Front Side Door Upper Hinge and Lower Hinge
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Upper Hinge and Lower Hinge Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the front wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> . 2. Remove the front fender insulator. Refer to <u>Front Fender Insulator Replacement</u> . 3. Remove the front side door. Refer to <u>Front Side Door Replacement</u> .	
1	Front Side Door Hinge Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 30 N.m (22 lb ft)
2	Front Side Door Hinge Procedure Adjust front side door as needed. Refer to <u>Front Side Door Adjustment</u> .

HOOD HINGE REPLACEMENT

Fig. 16: Hood Hinge

Courtesy of GENERAL MOTORS COMPANY

Hood Hinge Replacement

Callout	Component Name
Preliminary Procedure Remove the hood. Refer to <u>Hood Replacement</u> .	
1	Hood Hinge Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 18 N.m (13 lb ft)
2	Hood Hinge

LIFTGATE HINGE REPLACEMENT

Fig. 17: Liftgate Hinge
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Hinge Replacement

Callout	Component Name
Preliminary Procedure Remove the liftgate. Refer to <u>Liftgate Replacement</u> .	
1	Liftgate Hinge Nut (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 N.m (16 lb ft)
2	Liftgate Hinge

REAR SIDE DOOR UPPER HINGE AND LOWER HINGE REPLACEMENT

Fig. 18: Rear Side Door Upper Hinge and Lower Hinge
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Upper Hinge and Lower Hinge Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear side door. Refer to <u>Rear Side Door Replacement</u> .	
1	Rear Side Door Hinge Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 30 N.m (22 lb ft)
2	Rear Side Door Hinge Procedure Adjust rear side door as needed. Refer to <u>Rear Side Door Adjustment</u> .

HOOD ADJUSTMENT

Fig. 19: Hood

Courtesy of GENERAL MOTORS COMPANY

Hood Adjustment

Callout	Component Name
1	Hood CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Loosen the 4 hood hinge nuts. 2. Adjust the hood in order to obtain an even gap on both sides between the hood and the fenders, the headlamps and the front bumper fascia and so that the hood is flush with both fenders on the front edge, the front bumper fascia and the headlamps. Adjustment: • Hood to front fender (a) 3.0 mm $\pm$ 0.75 mm (0.12 in $\pm$ 0.03 in) • Hood to headlamp (b) 3.0 mm $\pm$ 1.0 mm (0.12 in $\pm$ 0.04 in) • Hood to front bumper fascia (c) 5.0 mm $\pm$ 1.0 mm (0.20 in $\pm$ 0.04 in) Tighten 18 (13 lb ft)

HOOD REPLACEMENT

Fig. 20: Hood Hinge Nut
Courtesy of GENERAL MOTORS COMPANY

Hood Replacement

Callout	Component Name
WARNING: When a hood hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.	
Preliminary Procedure Remove the windshield washer nozzle hose. Refer to <u>Windshield Washer Nozzle Hose Replacement</u> .	
1	Hood Hinge Nut (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 18 (13 lb ft)
2	Hood Procedure 1. Transfer components as necessary.

2. Adjust hood as needed. Refer to **Hood Adjustment**.

FRONT FENDER INSULATOR REPLACEMENT

Fig. 21: Front Fender Insulator

Courtesy of GENERAL MOTORS COMPANY

Front Fender Insulator Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> .	
1	Front Fender Insulator Retainer
2	Front Fender Insulator

HOOD PRIMARY AND SECONDARY LATCH REPLACEMENT

Fig. 22: Hood Primary and Secondary Latch
 Courtesy of GENERAL MOTORS COMPANY

Hood Primary and Secondary Latch Replacement

Callout	Component Name
Preliminary Procedure Remove air cleaner assembly. Refer to Air Cleaner Assembly Replacement .	
1	Hood Primary and Secondary Latch Retainer Bolt (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 8.5 N.m (75 lb in)
2	Hood Primary and Secondary Latch Procedure To release the hood primary and secondary latch unhook the hood primary latch release cable.

FRONT SIDE DOOR CHECK REPLACEMENT

Fig. 23: Front Side Door Check

Courtesy of GENERAL MOTORS COMPANY

Front Side Door Check Replacement

Callout	Component Name
Preliminary Procedure Remove front side door trim panel. Refer to Front Side Door Trim Panel Replacement .	
1	Front Side Door Check Link Bolt CAUTION: Refer to Fastener Caution . TIP: Place the door in the full open position. Tighten 28 N.m (21 lb ft)
2	Front Side Door Check Bolt (Qty: 2) Procedure Remove the water deflector. Tighten 5.5 N.m (49 lb in)
3	Front Side Door Check

FUEL TANK FILLER DOOR REPLACEMENT

Fig. 24: Fuel Tank Filler Door
 Courtesy of GENERAL MOTORS COMPANY

Fuel Tank Filler Door Replacement

Callout	Component Name
1	Fuel Tank Filler Door Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 5.5 N.m (49 lb in)
2	Fuel Tank Filler Door

HOOD HOLD-OPEN ROD REPLACEMENT

Fig. 25: Hood Hold-Open Rod
Courtesy of GENERAL MOTORS COMPANY

Hood Hold-Open Rod Replacement

Callout	Component Name
WARNING: Refer to <u>Hood Hold-Open Device Warning</u> .	
1	Hood Hold-Open Rod

HOOD REAR WEATHERSTRIP REPLACEMENT

Fig. 26: Hood Rear Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

Hood Rear Weatherstrip Replacement

Callout	Component Name
1	Hood Rear Weatherstrip

PLENUM LOWER PANEL REPLACEMENT

Fig. 27: Plenum Lower Panel

Courtesy of GENERAL MOTORS COMPANY

Plenum Lower Panel Replacement

Callout	Component Name
Preliminary Procedure 1. Remove the windshield wiper arm. Refer to <u>Windshield Wiper Arm Replacement</u> . 2. Remove the air inlet grille panel. Refer to <u>Air Inlet Grille Panel Replacement</u> . 3. Remove the windshield wiper transmission. Refer to <u>Windshield Wiper Transmission Replacement</u> .	
1	Plenum Lower Panel Bolt (Qty: 7) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 11.5 N.m (102 lb in)
2	Plenum Lower Panel

LIFTGATE STRUT REPLACEMENT

Fig. 28: Liftgate Strut

Liftgate Strut Bracket Replacement

Callout	Component Name
WARNING: When a lift gate hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.	
Preliminary Procedure Release the liftgate strut from the liftgate. Refer to <u>Liftgate Strut Replacement</u> .	
1	Liftgate Strut Bracket Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 20 N.m (15 lb ft)
2	Liftgate Strut Bracket

FRONT SIDE DOOR WEATHERSTRIP REPLACEMENT - DOOR SIDE

Fig. 30: Front Side Door Weatherstrip -- Door Side
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Weatherstrip Replacement - Door Side

Callout	Component Name
1	Front Side Door Check Link Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 28 N.m (21 lb ft)
2	Front Side Door Weatherstrip - Door Side Procedure Unclip weatherstrip from front side door.

FRONT SIDE DOOR WEATHERSTRIP REPLACEMENT - BODY SIDE

Fig. 31: Front Side Door Weatherstrip - Body Side
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Weatherstrip Replacement - Body Side

Callout	Component Name
1	Front Side Door Weatherstrip- Body Side Procedure 1. Start at the rear upper corner of the door opening and pull the weatherstrip away from the door opening flange. 2. Position the weatherstrip in the upper corner of the center pillar. 3. Working downward along the front edge, install the weatherstrip on the door opening flange ensuring that the carrier is fully seated in the corners. 4. Using a rubber mallet, ensure that the weatherstrip is seated on the entire door opening flange.

LIFTGATE WEATHERSTRIP REPLACEMENT

Fig. 32: Liftgate Weatherstrip
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Weatherstrip Replacement

Callout	Component Name
1	Liftgate Weatherstrip Procedure 1. Start at the upper corner of the liftgate opening and pull the weatherstrip away from the liftgate opening flange. 2. Position the weatherstrip in the upper corner of the liftgate opening. 3. Working downward along the edge, install the weatherstrip on the liftgate opening flange ensuring that the carrier is fully seated in the corners. 4. Using a rubber mallet, ensure that the weatherstrip is seated on the entire liftgate opening flange.

REAR SIDE DOOR WEATHERSTRIP REPLACEMENT - DOOR SIDE

Fig. 33: Rear Side Door Weatherstrip - Door Side
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Weatherstrip Replacement - Door Side

Callout	Component Name
1	Rear Side Door Check Link Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 28 N.m (21 lb ft)
2	Rear Side Door Weatherstrip - Door Side Procedure Unclip weatherstrip from front side door.

REAR SIDE DOOR WEATHERSTRIP REPLACEMENT - BODY SIDE

Fig. 34: Rear Side Door Weatherstrip - Body Side
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Weatherstrip Replacement - Body Side

Callout	Component Name
1	Rear Side Door Weatherstrip- Body Side Procedure 1. Start at the rear upper corner of the door opening and pull the weatherstrip away from the door opening flange. 2. Position the weatherstrip in the upper corner of the center pillar. 3. Working downward along the front edge, install the weatherstrip on the door opening flange ensuring that the carrier is fully seated in the corners. 4. Using a rubber mallet, ensure that the weatherstrip is seated on the entire door opening flange.

DESCRIPTION AND OPERATION

HOOD AJAR INDICATOR DESCRIPTION AND OPERATION

Hood Ajar Switch

The body control module (BCM) applies B+ to the hood ajar signal circuit and monitors the voltage to

determine the position of the hood. When the hood is closed, the switch is open and voltage remains high. When the hood is open, the switch is closed and the voltage is pulled low.

The BCM uses the hood ajar switch as a content theft deterrent alarm trigger.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Front Speaker Output Signal	B1025 02, 1	B1025 04, 1	B1025 01, 1, 2	-
Right Front Speaker Output Signal	B1035 02, 1	B1035 04, 1	B1035 01, 1, 2	-
Left Rear Speaker Output Signal	B1045 02, 1	B1045 04, 1	B1045 01, 1, 2	-
Right Rear Speaker Output Signal	B1055 02, 1	B1055 04, 1	B1055 01, 1, 2	-
1. No or reduced audio from speaker(s) on the affected audio circuit. 2. Noticeable audio distortion may be present.				

Circuit/System Description

Each of the audio output channel circuits (+) and (-), at the radio have a DC bias voltage that is approximately one half of battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5 V DC. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Conditions for Running the DTC

- Ignition is ON or in the ACC position
- The system voltage is 9-16 V
- The test is run once during radio wake up

Conditions for Setting the DTC

B1025 01, B1035 01, B1045 01, B1055 01

The radio detects a short to voltage on the specified audio (+) or (-) circuit.

B1025 02, B1035 02, B1045 02, B1055 02

The radio detects a short to ground on the specified audio (+) or (-) circuit.

B1025 04, B1035 04, B1045 04, B1055 04

The radio detects an open on the specified audio (+) or (-) circuit.

Action Taken When the DTC Sets

The radio continues to send the output signal to the speaker signal circuit with the current fault.

Conditions for Clearing the DTC

- A current DTC clears when the conditions for setting the DTC are no longer present and the ignition has been cycled from OFF to ON.
- A history DTC clears after 50 malfunction-free ignition cycles.

Diagnostic Aids

- Improper speaker mounting or loose trim may cause an audible buzz or distortion. Inspect the appropriate speaker and the surrounding interior trim for proper and secure mounting.
- The EL-50334-6 Audio System Diagnostic CD contains audio tracks that can be used to duplicate and isolate such concerns. Tracks 11 and 12 contain audio sweep tones for testing for speaker and grill rattles.
- The test tones on the CD may be copied to a USB drive or other device to use during testing.
- If the speaker or surrounding interior trim is found to be loose or improperly secured, correctly secure the item.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, A11 Radio ON, mute OFF.
2. Verify clear audio is heard from each speaker, adjusting fade and balance controls to test each speaker individually.
 - **If audio is inoperative from one or more speakers, or the audio emitted is not clear.**

Refer to Circuit/System Testing.

 - **If clear audio is heard from all speakers.**
3. All OK.

Circuit/System Testing

NOTE: **Some circuits supply audio signals to more than one speaker. It may be necessary to disconnect all speakers on the affected audio circuit when performing circuit tests.**

1. Ignition OFF, disconnect the harness connector at the appropriate P19 Speaker. Ignition ON, A11 Radio ON, mute OFF.
2. Test for 5-7 V between each audio signal circuit terminal 1 and terminal 2 and ground.
 - **If less than 5 V**
 1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio.
 2. Test for infinite resistance between the signal circuits and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the A11 Radio.
 - **If greater than 7 V**
 1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio. Ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the A11 Radio.

- If between 5-7 V

3. Test or replace the P19 Speaker.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Speaker Replacement Reference**
- **Control Module References** for radio replacement, programming, and setup.

DTC B125A: ANTENNA SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B125A 02

Antenna Signal Circuit Short to Ground

DTC B125A 04

Antenna Signal Circuit Open Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Radio Antenna Coax	B125A 02	B125A 04	1	-
Ground	-	1	-	-
1. May exhibit possible AM/FM interference.				

Circuit/System Description

The multi-band antenna is located on the roof of the vehicle. The radio antenna is enabled when the radio is turned on. The radio provides battery voltage to the antenna using the center conductor of the antenna coaxial cable. When a 12 V signal is seen on the center conductor of the antenna coax, both AM and FM signals are amplified.

Conditions for Running the DTC

- Ignition ON.

- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B125A 02

The radio detects a short to ground in the antenna signal circuit center conductor.

B125A 04

The radio detects an open in the antenna signal circuit center conductor.

Action Taken When the DTC Sets

Radio reception may be poor or not available.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles have occurred.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, A11 Radio ON.
2. Verify station reception is normal when tuned to several known good AM and FM stations.
 - **If AM or FM reception is poor.**

Refer to Circuit/System Testing

- **If reception is normal**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the radio antenna coax cable from the A11 Radio and from the T4M Radio Antenna.
 2. Verify the antenna coax cable passes the coax cable component test. Refer to Component Testing.
 - **If the coax cable does not pass the test**
- Replace the antenna coax cable
- **If the coax cable passes the test**
3. Connect the radio antenna coax cable to the A11 Radio.
 4. Ignition ON, A11 Radio ON.
 5. Verify a test lamp illuminates between the antenna coax cable center terminal at the T4M Radio Antenna and chassis ground.
 - **If the test lamp does not illuminate**

Replace the A11 Radio.

- **If the test lamp illuminates**
6. Test or replace the T4M Radio Antenna.

Component Testing

CAUTION: Refer to Test Probe Caution .

NOTE: Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 ohms between coax cable center terminal end to end.
 - **If 5 ohms or greater**

Replace the coax cable

- **If less than 5 ohms**
3. Test for less than 5 ohms between the coax cable outer shield end to end.
 - **If 5 ohms or greater**

Replace the coax cable

- **If less than 5 ohms**
4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
 - **If less than infinite resistance**

Replace the coax cable

- **If infinite resistance**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Radio Antenna Base Replacement**
- **Control Module References** for radio replacement, programming, and setup.

DTC Descriptors

DTC B125C 01

Satellite Antenna Circuit Short to Battery

DTC B125C 02

Satellite Antenna Circuit Short to Ground

DTC B125C 04

Satellite Antenna Circuit Open

Circuit/System Description

The digital radio receiver, located inside the radio, receives digital radio information from the digital radio antenna located on the outside of the vehicle. The digital radio receiver is connected to the digital radio antenna via a shielded coax cable. The digital radio antenna contains an amplifier which is powered by the radio through the coax cable.

Conditions for Running the DTC

This DTC is run every 300 milliseconds.

Conditions for Setting the DTC

The radio detects a circuit fault in the digital radio antenna.

Action Taken When the DTC Sets

The radio displays No XM Signal or Check Antenna.

Conditions for Clearing the DTC

- A current DTC clears when the condition for setting the DTC is no longer present.
- A history DTC clears after 100 malfunction-free ignition cycles.

Diagnostic Aids

The digital radio antenna requires a clear line of sight to the sky to operate properly. Reception may be limited, intermittent, or unavailable inside structures.

Description and Operation

Radio/Audio System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Special Tools

EL-48028 Digital Radio Test Antenna

Circuit/System Verification

1. With the vehicle outside in an area with an unobstructed view of the southern sky, tune to XM.
2. Verify DTC B125C is not set as current and the No XM Signal or Check Antenna message is not displayed on the radio.
 - **If DTC B125C is set as current or the No XM Signal or Check Antenna message is displayed.**

Refer to Circuit/System Testing.
 - **If DTC B125C is not set as current and the No XM Signal or Check Antenna message is not displayed.**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the digital radio antenna coax cable from the A11 radio. Connect the **EL-48028** digital radio test antenna to the radio and place on the roof of the vehicle.
2. Ignition ON, radio tuned to XM channel 1.

3. Verify DTC B125C is not set as current and XM reception is improved.

- **If DTC B125C is set as current or XM reception is not improved**

Replace the A11 radio.

- **If DTC B125C is not set as current and XM reception is improved**

4. Ignition OFF, disconnect the digital radio antenna coax cable from the T4D cellular phone, navigation, and digital radio antenna.

5. Verify the digital radio antenna coax cable passes the coax cable component test. Refer to Component Testing.

- **If the coax cable does not pass the test**

Replace the antenna coax cable

- **If the coax cable passes the test**

6. Replace the T4D cellular phone, navigation, and digital radio antenna.

Component Testing

CAUTION: Refer to Test Probe Caution .

NOTE: Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.

2. Test for less than 5 ohms between coax cable center terminal end to end.

- **If 5 ohms or greater**

Replace the coax cable

- **If less than 5 ohms**

3. Test for less than 5 ohms between the coax cable outer shield end to end.

- **If 5 ohms or greater**

Replace the coax cable

- **If less than 5 ohms**

4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
 - **If less than infinite resistance**

Replace the coax cable

- **If infinite resistance**

5. All OK

Repair Instructions

DTC B1271: THEFT PROTECTION ACTIVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1271 00

Theft Protection Active

Circuit/System Description

When the radio is initially installed in the vehicle, the radio receives VIN information via serial data. The radio stores a portion of the VIN and compares this sequence to the VIN information received each time the radio powers on. The VIN in the radio is a single one-time learn.

The radio theft deterrent system is intended to disable or limit radio functionality if incorrect vehicle information is received by the radio. The radio disables functionality if the VIN information received by the radio does not match the VIN information that has been learned by the radio. This DTC is generated by the module when the Theft Protection is activated.

Conditions for Running the DTC

This DTC test runs when the radio changes from OFF to ON.

Conditions for Setting the DTC

The radio has learned a correct VIN sequence and the VIN information received via serial data does NOT match the learned VIN sequence.

Action Taken When the DTC Sets

- The radio may be disabled or have limited functionality.
- The radio display will indicate that theft protection is active.

Conditions for Clearing the DTC

The radio receives the correct VIN information via serial data.

Diagnostic Aids

A possible cause of incorrect VIN info could be the radio was originally installed in another vehicle.

DTC B1446 OR B1447: BACKUP POWER SOURCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1446

Replace Backup Power Source Below Minimum Threshold

DTC B1447

Backup Power Source Open Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Backup Battery B+	B1447 03	B1447 04	-	-
Backup Battery Low Reference	B1447 03	B1447 04	-	-

Circuit/System Description

The backup power source provides voltage to the telematics communication interface control module, to be able to successfully place a call in the event of a main battery disconnect during a collision event.

Conditions for Running the DTC

B1446 03

- Ignition is ON.
- System voltage is between 9.5 and 15.5 V.
- DTC B1447 is not set.

B1447 04

- Ignition is ON.
- System voltage is between 9.5 and 15.5 V.
- The above conditions are present for greater than 10 s.

Conditions for Setting the DTC

B1446 03

The telematics communication interface control module detects that the backup power source voltage has dropped below the minimum threshold value.

B1447 04

The telematics communication interface control module detects no voltage from the backup power source.

Action Taken When the DTC Sets

B1446 03

The OnStar® status LED turns red.

B1447 04

- The OnStar® status LED turns red.
- The telematics communication interface control module will be unable to place a call in the event of a main battery disconnect during a collision event.

Conditions for Clearing the DTC

- A current DTC B1446 will clear when the telematics communication interface control module detects the voltage of the backup power source is above the minimum threshold value.
- A current DTC B1447 will clear when the telematics communication interface control module detects voltage from the backup power source.
- A history DTC clears after 50 malfunction-free ignition cycles.

Diagnostic Aids

- Shorting the backup power source positive voltage circuit to the backup power source ground circuit or chassis ground will activate the internal circuit protection of the backup power source, rendering the backup power source inoperative.

- DTC B1447 may set if the K73 Telematics Communication Interface Control Module has been incorrectly disconnected or serviced. When disconnecting the K73 Telematics Communication Interface Control Module, disconnect the harness connector X1 at the K73 Telematics Communication Interface Control Module prior to disconnecting any other harness connectors. This will ensure the backup power source is preserved when voltage is removed from the K73 Telematics Communication Interface Control Module.

DTC Descriptors

DTC B2455 02

Cellular Phone Microphone Circuit Short to Ground

DTC B2455 04

Cellular Phone Microphone Circuit Open/High Resistance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Microphone Signal	B2455 02	B2455 04	B2455 04	-
Microphone Low Signal	B2455 02	B2455 04	B2455 04	-

Circuit/System Description

The telematics communication interface control module provides the cellular phone microphone with a supplied voltage on the cellular phone microphone high signal circuit. When the microphone is in use, voice data from the user is sent back to the telematics communication interface control module on the microphone low signal circuit.

Conditions for Running the DTC

- The ignition must be in the RUN or ACC position.
- The system voltage is at least 9.5 V and no more than 15.5 V.
- All the above conditions are present for greater than 10 s.

Conditions for Setting the DTC

B2455 02

The telematics communication interface control module detects an short to ground in the cellular phone

microphone high signal circuit for 10 s or greater.

B2455 04

The following conditions will set this DTC:

- The telematics communication interface control module detects an open/high resistance in the cellular phone microphone high signal circuit for 10 s or greater.
- The telematics communication interface control module detects an open/high resistance in the microphone low signal circuit for 10 s or greater.

Action Taken When the DTC Sets

- The OnStar® status LED turns red.
- The telematics communication interface control module will not receive a signal from the cellular phone microphone.
- Calls can be placed but the caller cannot be heard.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B24 Cellular Phone Microphone, ignition ON.
2. Test for 8.0-10.5 V between the signal circuit terminal B and ground.
 - **If less than 8.0 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the vehicle K73 Telematics Communication Interface Control Module.
 - **If greater than 10.5 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
 - **If between 8.0-10.5 V**
3. Test for less than 1 V between the signal circuit terminal A and ground.
 - **If greater than 1 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, repair the K73 Telematics Communication Interface Control Module.
 - **If less than 1 V**
4. Test for greater than 8 V between the signal circuit terminal B and the signal circuit terminal A.
 - **If less than 8 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
 2. Test for infinite resistance between the low signal circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the vehicle K73 Telematics Communication Interface Control Module.

- **If greater than 8 V**

5. Test or replace the B24 Cellular Phone Microphone.

Circuit/System Verification

NOTE: **It is necessary to have the vehicle in a quiet, open outside area where a cellular call can be successfully placed.**

1. Ignition ON.
2. Verify that DTC B2455 is set.
 - **If DTC B2455 is not set**

All OK.
 - **If DTC B2455 is set**
3. Verify that your voice can be heard clearly after placing a cellular call.
 - **If your voice can not be heard clearly**

Refer to Circuit/System Testing.
 - **If your voice can be heard clearly**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B24 Cellular Phone Microphone, ignition ON.
2. Test for 9.5-10.5 V between the signal circuit terminal B and ground.
 - **If less than 9.5 V**
 1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the A11 Radio.
- **If greater than 10.5 V**
- 1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio, ignition ON.
- 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the A11 Radio.
- **If between 9.5-10.5 V**
- 3. Ignition ON.
- 4. Test for less than 1 V between the signal circuit terminal A and ground.
 - **If greater than 1 V**
 - 1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio, ignition ON.
 - 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, replace the A11 Radio.
 - **If less than 1 V**
- 5. Test for 9.5-10.5 V between the signal circuit terminal B and the signal circuit terminal A.
 - **If less than 9.5 V**
 - 1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio.
 - 2. Test for infinite resistance between the signal circuit terminal A and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the signal circuit terminal A end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the vehicle A11 Radio.
 - **If greater than 10.5 V**
 - 1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio, ignition ON.
 - 2. Test for less than 1 V between the signal circuit terminal A and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the A11 Radio.
 - **If between 9.5-10.5 V**
- 6. Test or replace the B24 Cellular Phone Microphone.

Cellular Phone Antenna Circuit Malfunction Open Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cellular Antenna Signal	B2470 02	B2470 04	-	-

Circuit/System Description

The cellular phone, navigation, and digital radio antenna is connected to the telematics communication interface control module. This module supplies 5 V to the cellular phone, navigation, and digital radio antenna to power the internal amplifier.

Conditions for Running the DTC

- Ignition in the RUN or ACC position.
- System voltage is between 9.5 V and 15.5 V.
- The above conditions are present for greater than 1 s.

Conditions for Setting the DTC

The telematics communication interface control module does not detect the presence of a cellular phone antenna.

Action Taken When the DTC Sets

- The vehicle is unable to connect to the OnStar® Call Center.
- The OnStar® status LED turns red.

Conditions for Clearing the DTC

- The telematics communication interface control module detects the presence of a cellular phone antenna.
- A history DTC clears after 50 malfunction-free ignition cycles.

EL-49903 GM OnStar Antenna Diagnostic Tool Kit

Circuit/System Verification

NOTE: The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 minutes after turning the ignition ON for the GPS satellites to acquire vehicle signal.

1. Ignition ON.
2. Verify that DTC B2470 is not set.
 - **If DTC B2470 is set**

Refer to Circuit/System Testing

- **If DTC B2470 is not set**
- 3. Verify that a call can be successfully placed to the OnStar Call Center by pressing the blue OnStar button.
 - **If unable to connect with the OnStar Call Center.**

Refer to **Unable to Contact OnStar Call Center**

- **If able to connect with the OnStar Call Center**
- 4. All OK.

Circuit/System Testing

NOTE:

- **The vehicle may be equipped with sectioned coax. Test each section and replace only the faulty section, not the entire length of coax.**
- **The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 min after turning the ignition ON for the GPS satellites to acquire vehicle signal.**

1. Ignition OFF and all vehicle systems OFF, disconnect the GPS and cellular coax cable connector at the K73 Telematics Communication Interface Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Using the EL-49903-3 kit (EL-49903-5 adapter and EL-49903-4 coax cable), connect the **EL-49903** GM OnStar antenna diagnostic tool kit to the K73 Telematics Communication Interface Control Module. Place the test antenna on the roof of the vehicle, ignition ON.
3. Verify the DTC does not set while operating the vehicle within the conditions for running the DTC.
 - **If the DTC sets**

Replace the K73 Telematics Communications Interface Control Module.

- **If the DTC does not set**
- 4. Ignition OFF.
- 5. Disconnect the **EL-49903** GM OnStar antenna diagnostic tool kit from the K73 Telematics Communication Interface Control Module
- 6. Test the coax cable. Refer to Component Testing.
 - **If the coax cable does not pass the test**

Replace the coax cable.

- **If the coax cable passes the test**
- 7. Test or replace the T4G Cellular Phone, Navigation, and Digital Radio Antenna.

Component Testing

CAUTION: Refer to **Test Probe Caution**

NOTE:

- Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.
- To prevent false readings when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 ohms between the coax cable center terminal end to end.
 - **If 5 ohms or greater**

Replace the coax cable.

- **If less than 5 ohms**
3. Test for greater than 5 ohms between the coax cable outer shield end to end.
 - **If 5 ohms or greater**

Replace the coax cable.

- **If less than 5 ohms**
4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
 - **If less than infinite resistance**

Replace the coax cable.

- **If infinite resistance**
5. All OK.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
10 V Reference	B2476 04	B2476 04	B2476 04	-
Signal Terminal B	B2476 04	B2476 04	B2476 59	B2476 59, B2482 00
Ground	-	B2476 04	-	-

Circuit/System Description

The OnStar® button assembly consists of 3 buttons: Call/Answer, OnStar® Call Center, and OnStar® Emergency. The telematics communication interface control module supplies the OnStar® button assembly with 10 V via the 10 V reference circuit. Each of the buttons, when pressed, completes the circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module over the keypad signal circuit. Depending upon the voltage range returned, the telematics communication interface control module is able to identify which button has been pressed.

Conditions for Running the DTC

- Vehicle ON.
- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B2476 04

The telematics communication interface control module detects an open/high resistance on the keypad supply voltage circuit.

B2482 and B2476 59

The telematics communication interface control module detects a valid signal on the keypad signal circuit for longer than 15 s. If one of the OnStar® buttons is held or stuck for 15 s or greater, the telematics communication interface control module will set this DTC.

Action Taken When the DTC Sets

- The OnStar® status LED turns red.
- No calls can be placed.
- The telematics communication interface control module will ignore all inputs from the OnStar® button assembly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

NOTE:

- **10 V reference circuit measurement may vary with vehicle battery voltage.**
- **Test for voltage range with vehicle battery measuring at a minimum of 11.5 V**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal E and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for 8.0-10.5 V between the 10 V reference circuit terminal A and ground.
 - **If less than 8.0 V**
 1. Ignition OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module.
 2. Test for infinite resistance between the 10 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 10 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K73 Telematics Communication Interface Control Module.
 - **If greater than 10.5 V**
 1. ignition OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the 10 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
 - **If between 8.0-10.5 V**
5. ignition OFF.
6. Test for 500-900 ohms between the signal circuit terminal B and ground.
 - **If less than 500 ohms**
 1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K73 Telematics Communication Interface Control Module.

- **If greater than 900 ohms**
- 1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, vehicle in Service Mode.
- 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
- 3. ignition OFF.
- 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K73 Telematics Communication Interface Control Module.
- **If between 500-900 ohms**
- 7. Test or replace the A10 Inside Rearview Mirror.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Inside Rearview Mirror Replacement**
- **Control Module References** for telematics communication interface control module replacement, programming and setup.

DTC B2485: WIRELESS COMMUNICATION (BT) ANTENNA

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptors

DTC B2485 02

Wireless Communication (BT) Antenna Circuit Short to Ground

DTC B2485 04

Wireless Communication (BT) Antenna Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B2485 02	B2485 04	-	-

Circuit/System Description

Bluetooth ® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. The operating range of the signal is approximately 30 feet.

The Bluetooth ® antenna is a small fixed antenna connected directly to the telematics communication interface control module and is used to send and receive signals from a Bluetooth ® enabled cellular phone.

Conditions for Running the DTC

- The ignition is in OFF, ACCESSORY or RUN position.
- The system voltage is between 9-16 V.
- The telematics communication interface control module tests the antenna once every second.

Conditions for Setting the DTC

B2485 02

- The signal voltage is less than 1 V.
- The above conditions must be met for 500 ms.

B2485 04

- The signal voltage is greater than 2 V.
- The above conditions must be met for 500 ms.

Actions Taken When the DTC Sets

- The OnStar ® status LED turns red.
- Bluetooth ® functionality is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

- Verify the mobile device is properly configured for the feature being used. Refer to the device manufacturers information.
- Verify the function/feature that is being used is supported by the mobile device.
- The device must be paired to the telematics communication interface control module to use the available Bluetooth ® feature(s). The pairing process must only be performed once for each device, unless that device's information is deleted.
- The system can store pairing information for multiple devices, but can only be actively connected to one

at any given time.

Description and Operation

OnStar Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Special Tools

EL-50334-20 Multi-Media Interface Tester (Multi-Media Interface Tool)

Circuit/System Testing

1. Verify that the T4S Wireless Communication Antenna - Bluetooth ® is properly connected to the K73 Telematics Communication Interface Control Module and is not damaged.
 - **If the antenna is disconnected**

Connect the T4S Wireless Communication Antenna - Bluetooth ® to the module.
 - **If the antenna is damaged**

Test or replace the T4S Wireless Communication Antenna - Bluetooth ®.
 - **If the antenna is connected and not damaged**

NOTE: **The Multi-Media Interface Tool tool can be used to test either cellular phone or streaming audio functions. Refer to the tool instructions, and perform the appropriate test(s) related to the customers concern in the following steps.**

2. Ignition ON, infotainment system ON.
3. Verify the infotainment system successfully pairs with the Multi-Media Interface Tool.
 - **If the infotainment system does not successfully pair with the Multi-Media Interface Tool.**
 1. Test or replace the T4S Wireless Communication Antenna - Bluetooth ®.
 2. Clear the DTC, ignition OFF.
 3. Ignition ON.
 4. Verify the DTC is not set.
 - If the DTC is set, replace the K73 Telematics Communication Interface Control Module.
 - If the DTC is not set
 5. All OK.
 - **If the infotainment system successfully pairs with the Multi-Media Interface Tool.**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for telematics communication interface control module replacement, programming and setup.

SYMPTOMS - CELLULAR COMMUNICATION

NOTE: **The following steps must be completed before using the symptom table.**

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **OnStar Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to **Checking Aftermarket Accessories** .
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **No Global Positioning System (GPS) Reception**
- **OnStar Microphone Malfunction**
- **OnStar Audio Malfunction**
- **OnStar Button LED Malfunction**
- **OnStar Call Center Remote Function Requests Malfunction**
- **OnStar Button Malfunction**
- **Unable to Contact OnStar Call Center**
- **OnStar Voice Recognition Malfunction**
- **OnStar Steering Wheel Control Functions Malfunction**

SYMPTOMS - ENTERTAINMENT

IMPORTANT: The following steps must be completed before using the symptom table.

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Radio/Audio System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to **Checking Aftermarket Accessories**.
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Application Malfunction**
- **Auxiliary Audio Input Malfunction**
- **Bluetooth Malfunction (UF7/UH7), Bluetooth Malfunction (UE1 without UF7/UH7)**

- **Digital Radio Poor or No Reception**
- **Radio Poor Reception**
- **Speaker Malfunction**

APPLICATION MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Circuit/System Description

The term application refers to any piece of software that works on a system (hardware) that is being operated by its own software. Applications are typically small software programs which uses the hardware to perform a specific task, as opposed to operating the entire system.

Diagnostic Aids

- For an application to be used, it must be installed on both the vehicle infotainment system and a compatible mobile device.
- The application must work correctly on the device to work with the vehicle infotainment system.
- The user may be required to log-in to the application on the mobile device before using the application from the vehicle controls.
- Applications use the mobile device and connection to a service provider to operate. Connection quality issues, or service provider data transmission issues can give the appearance of a vehicle malfunction.
- The device must be connected to the system. This may be done wirelessly via Bluetooth ®, or via the vehicle USB port.

When a mobile device is connected via Bluetooth®, some or all of the device controls may be unavailable from the radio controls. This varies dependant upon the device being used. Refer to the vehicle owners manual, supplements, and the device manufacturers information for information on devices, control, and operation.

Refer to the device manufacturers information for the preferred connection method.

- The device must be unlocked, and any additional applications should be closed.
- If the device has any sound enhancement features such as noise reduction or echo control, these features should be turned off.
- A low battery condition in the mobile device may not allow the device to connect to the system, or can create communication issues with the device. Verify the device battery state of charge and re-charge or replace as needed.
- If a 'Please See Device' or similar type error message is displayed, this may indicate the device has lost its connection to the vehicle, or the device has lost its external data connection.

- If a cable is used for connection, attempt to connect the device using a different cable; cables can deteriorate over time or become damaged.

Circuit/System Verification

1. Verify the application is installed on the mobile device and is up to date.
 - **If the application is not installed or is not up to date.**

Install or update the application on the device.
 - **If the application is installed on the mobile device and is up to date**
2. Verify the application operates correctly on the mobile device.
 - **If the application is not operating correctly on the mobile device.**

Refer to the application website.
 - **If the application is operating correctly on the mobile device.**
3. Verify the A11 Radio calibrations are current.
 - **If the radio calibrations are not current**

Reprogram the A11 Radio and re-evaluate the concern.

- **If no update calibrations are available**

4. Verify the application is installed on the A11 Radio and is up to date.

- **If the application is not installed or is not up to date.**

Install or update the application on the A11 Radio.

- **If the application is installed on the A11 Radio and is up to date**

5. Ignition ON, A11 Radio ON.

6. Verify the mobile device can connect to the infotainment system. Refer to the owners manual for information on the preferred connection method for the device.

- **If the mobile device cannot connect to the vehicle infotainment system.**

- If unable to connect via Bluetooth, refer to **Bluetooth Malfunction (UF7/UH7)**, **Bluetooth Malfunction (UE1 without UF7/UH7)**.

- If unable to connect via USB, refer to **Auxiliary Audio Input Malfunction**.

- **If the mobile device connects to the vehicle infotainment system.**

7. Launch the application.

8. Verify the applications operates properly with the vehicle infotainment system.

- **If the application does not function properly**

Refer to diagnostic aids.

- **If the application functions properly**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for radio replacement, programming, and setup.

AUXILIARY AUDIO INPUT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
---------	-----------------	----------------------	------------------	--------------------

Auxiliary Audio Common Signal	-	6	-	-
Auxiliary Detection Signal	5	6	-	-
Left Auxiliary Audio Signal	2	2	2, 4	-
Right Auxiliary Audio Signal	3	3	3, 4	-
USB Cable	1	1	1	-
1. USB port Inoperative 2. No left side audio from device connected to AUX jack 3. No right side audio from device connected to AUX jack 4. Noticeable distortion may be present in affected audio channel 5. Radio does not detect auxiliary device connection, AUX not available as input selection 6. AUX always available as an input selection, with or without auxiliary device connected				

Circuit/System Description

Auxiliary Audio Input Jack

The 3.5 mm auxiliary audio input jack is located in the console. All circuits from the auxiliary jack are connected directly to the radio. Audio signals from the device are sent to the radio from the auxiliary input jack via the left, right, and common audio signal circuits.

The infotainment system may also have an additional auxiliary audio input jack available on the radio face. This input interfaces internally with the radio, no external circuits are involved.

When a portable audio playback device is connected to an auxiliary jack, an internal switch detects the connection and the radio will switch to AUX as the audio source.

USB Port

The vehicle may be equipped with a USB port in the console. This port allows USB connectivity to the infotainment system from portable media players or a USB storage device (memory stick/flash drive). When a device is connected to the USB port, the system detects the device and switches to USB as the audio source. Once connected, the device can be controlled from the radio controls.

The USB port is connected to the radio via a standard USB cable. Mini type USB connectors are used to connect the cable at the USB port and at the radio. Standard USB male to female connections are typically used for connecting USB cables together where an in-line connection is required. An in-line cable connection is typically found between the console and I/P harness.

Not all portable media player devices are compatible. Refer to the owner's manual for information on USB devices, control, and operation.

Diagnostic Aids

Auxiliary Audio Input Jack

- When a device is first connected to the 3.5 mm (1/8 in) input jack the infotainment system automatically

switches to that device. If an auxiliary device has already been connected, press the AUX or CD/AUX button to select the device.

- If the system detects the device, but the audio is not heard or is not clear, attempt to connect the device using a different cable; cables can deteriorate over time or become damaged.
- Playback of an audio device that is connected to the 3.5 mm jack can only be controlled using the controls on the device.
- The volume control on the device may need to be adjusted to ensure sufficient playback volume through the infotainment system.

USB

- When a device is first connected to the USB port, the infotainment system automatically switches to that device. If an auxiliary device has already been connected, press the AUX or CD/AUX button to select the device.
- A low battery condition in a portable media player may not allow the device to connect to the system, or can create communication issues with the device. Verify the device battery state of charge and re-charge or replace as needed.
- Connect the device directly to the USB port if possible. Only use a cable if it is required to connect the device. The use of extension cables can cause communication issues.
- If a cable is required for connection, attempt to connect the device using a different cable; cables can deteriorate over time or become damaged.
- Attempt audio playback from multiple USB devices when diagnosing USB concerns. Device compatibility can vary based on vehicle equipment. If the infotainment system is capable of operating any USB type device, the cause of the concern is not with the vehicle system. The inoperative device(s) may be incompatible or contain no recognized media types.
- If a 'Device Not Supported' or similar type error message is displayed, this indicates the system has connected to the device but cannot communicate with it properly. This does not indicate an issue with the vehicle system. The device may be incompatible, may require a 'reset', or may require an update to its software/firmware.
- If a 'No Supported Data Found' or similar type error message is displayed, this indicates the system has connected to the device and is communicating, but cannot find any compatible files/data. This does not indicate an issue with the vehicle system. Verify the device contains compatible media/file types.
- Poor connections or damaged USB cables can cause intermittent or no operation of USB devices. Inspect connectors, terminals, and cables for damage and replace components as necessary. Ensure all USB inline connections and connections at components are fully seated and connector position retainers/locks are secure.

Circuit/System Verification

Auxiliary Audio Input Jack - Console

1. Verify no DTCs are present.
 - **If any DTCs are present**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are present**

2. Ignition ON, radio ON.
3. Verify the infotainment system switches to AUX as the audio source with the **EL-50334-20** Multi-Media Interface Tester (MIT) connected to the auxiliary audio input jack.
 - **If the infotainment system does not switch to AUX as the audio source**

Refer to Circuit/System Testing - Auxiliary Audio Input Jack.

- **If the infotainment system switches to AUX as the audio source**

4. Verify the audio from the **EL-50334-20** Multi-Media Interface Tester (MIT) is heard through the vehicle infotainment system while operating the test tool to begin audio playback.
 - **If audio is not heard from the test tool**

Refer to Circuit/System Testing - Auxiliary Audio Input Jack

- **If audio is heard from the test tool**

5. All OK

Auxiliary Audio Input Jack - Radio (If Equipped)

1. Verify no DTCs are present.

- **If any DTCs are present**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are present**

2. Ignition ON, radio ON.

3. Verify the infotainment system switches to AUX as the audio source with the **EL-50334-20** Multi-Media Interface Tester (MIT) connected to the auxiliary audio input jack.

- **If the infotainment system does not switch to AUX as the audio source**

Replace the A11 Radio.

- **If the infotainment system switches to AUX as the audio source**

4. Verify the audio from the **EL-50334-20** Multi-Media Interface Tester (MIT) is heard through the vehicle infotainment system while operating the test tool to begin audio playback.

- **If audio is not heard from the test tool**

Replace the A11 Radio.

- **If audio is heard from the test tool**

5. All OK.

USB Port

1. Verify no DTCs are present.

- **If any DTCs are present**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are present**

2. Ignition ON, radio ON.

3. Verify the infotainment system switches to USB as the audio source with the **EL-50334-20** Multi-Media Interface Tester (MIT) connected to the USB port.

- **If the infotainment system does not switch to USB as the audio source**

Refer to Circuit/System Testing - USB Port.

- **If the infotainment system switches to USB as the audio source**

4. Verify the audio from the **EL-50334-20** Multi-Media Interface Tester (MIT) is heard through the vehicle infotainment system while operating the system to play audio from the test tool.

- **If audio is not heard from the test tool**

Refer to Circuit/System Testing - USB Port.

- **If audio is heard from the test tool**

5. All OK.

Circuit/System Testing

Auxiliary Audio Input Jack

1. Ignition OFF, disconnect the X1 harness connector at the X83 Auxiliary Audio Input. Ignition ON, radio ON.

2. Test for 2.5-3.5 V between the signal circuit terminal 5 and ground.

- **If less than 2.5 V**

1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 ohms in the signal circuit end to end

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the A11 Radio.

- **If greater than 3.5 V**

1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio, ignition ON.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the A11 Radio.

- **If between 2.5-3.5 V**

3. Test for less than 1 V between the signal circuits listed below and ground:

- Left auxiliary audio signal circuit terminal 1

- Right auxiliary audio signal circuit terminal 2

- Auxiliary audio common signal circuit terminal 3

- **If 1 V greater**

1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio. Ignition ON.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the A11 Radio.

- **If less than 1 V**

4. Ignition OFF, disconnect the X1 harness connector at the A11 Radio.
5. Test for infinite resistance between the signal circuits listed below and ground:
 - Auxiliary audio common signal circuit terminal 23
 - Left auxiliary audio signal circuit terminal 24
 - rRght auxiliary audio signal circuit terminal 10
 - **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**
6. Test for less than 5 ohms between the signal circuit terminals listed below:
 - A11 Radio terminal 24 X1 and the X83 Auxiliary Audio Input terminal 1 X1
 - A11 Radio terminal 10 X1 and the X83 Auxiliary Audio Input terminal 2 X1
 - A11 Radio terminal 23 X1 and the X83 Auxiliary Audio Input terminal 3 X1
 - **If 5 ohms greater**

Repair the open/high resistance in the circuit.

- **If less than 5 ohms**
7. Replace the X83 Auxiliary Audio Input. Connect all harness connectors.
 8. Connect and operate the **EL-50334-20** Multi-Media Interface Tester (MIT).
 9. Verify the audio from the test tool is heard through the vehicle infotainment system.
 - **If audio is not heard from the test tool**

Replace the A11 Radio.

- **If audio is heard from the test tool**
10. All OK.

USB Port

1. Ignition OFF, disconnect the USB cable connection at the A11 Radio.

NOTE: **USB cables and adapters for the following tests are found in the EL-50334-50 USB Cable and Adapter Kit.**

2. Connect the EL-50334-2 Type A female to Mini B male USB Cable to the A11 Radio.
3. Connect the **EL-50334-20** Multi-Media Interface Tester (MIT) to the EL-50334-2 cable. Ignition ON, radio ON
4. Verify the infotainment system switches to USB as the audio source.
 - **If the infotainment system does not switch to USB as the audio source**

Replace the A11 Radio.

- **If the infotainment system switches to USB as the audio source**

5. Ignition OFF, connect the vehicle USB cable to the A11 Radio. Disconnect the USB cable at the X83 Auxiliary Audio Input.

NOTE: **The EL-50334-4 adapter may be required for the following test.**

6. Connect the **EL-50334-20** Multi-Media Interface Tester (MIT) to the vehicle USB cable. Ignition ON, radio ON.
7. Verify the infotainment system switches to USB as the audio source.
 - **If the infotainment system does not switch to USB as the audio source**

Replace the USB cable assembly.

- **If the infotainment system switches to USB as the audio source**

8. Test or replace the X83 Auxiliary Audio Input.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **USB Receptacle Replacement**
- **Control Module References** for radio replacement, programming, and setup.

BLUETOOTH MALFUNCTION (UF7/UH7)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Circuit/System Description

Bluetooth ® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. The operating range of the signal is approximately 30 feet.

The available features and functions are determined by the type of device and the software within the devices being used. For a feature or function to operate, it must be supported in both devices.

The Bluetooth ® hardware is internal to the radio. The radio supports streaming of data (music, voice, information) from cellular phones and other mobile devices that support those features. The radio may also be capable of interfacing with cellular phones for hands-free features.

Refer to the vehicle owners manual, supplements, and the device manufacturers information for information on devices, control, operation. and pairing instructions.

Diagnostic Aids

- Verify the mobile device is properly configured for the feature being used. Refer to the device manufacturers information.
- Verify the function/feature that is being used is supported by the mobile device.
- The device must be paired to the radio to use the available Bluetooth ® feature(s). The pairing process must only be performed once for each device, unless that device's information is deleted.
- The system can store pairing information for multiple devices, but can only be actively connected to one at any given time.

1. Verify no DTCs are present.
 - **If any DTCs are present**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are present**
2. Verify the A11 Radio calibrations are current.
 - **If the radio calibrations are not current**

Reprogram the A11 Radio and re-evaluate the concern.

- **If no update calibrations are available**

NOTE: **The MIT tool can be used to test either cellular phone or streaming audio functions. Refer to the tool instructions, and perform the appropriate test (s) related to the customers concern in the following steps.**

3. Ignition ON, infotainment system ON.
4. Verify the infotainment system successfully pairs with the MIT tool.
 - **If the infotainment system does not successfully pair with the MIT tool.**

Replace the A11 Radio.

- **If the infotainment system successfully pairs with the MIT tool.**

5. Verify the infotainment system successfully completes the desired feature test using the MIT tool.
 - **If the feature test is not successful**

Replace the A11 Radio.

- **If the feature test is successful**

6. All OK. Refer to Diagnostic Aids.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for radio replacement, programming, and setup

BLUETOOTH MALFUNCTION (UE1 WITHOUT UF7/UH7)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Circuit/System Description

The Bluetooth ® antenna is internal to, or is a small fixed antenna connected directly to, the telematics communication interface control module and is used to send and receive signals from a Bluetooth ® enabled cellular phone. The antenna utilizes no cabling and is not external to the vehicle.

In order to use hands-free calling, the cellular phone must be paired to the vehicle. Up to five devices can be paired to the vehicle at one time, but only one can be connected at any given time. To pair a phone, the customer must know how to operate the Bluetooth ® functionality of their phone. The pairing process must only be done one time for each phone, unless that phone's information is deleted. For safety reasons, the pairing process is disabled while the vehicle is moving.

Diagnostic Aids

- The purpose of this diagnostic is to verify the ability of the telematics communication interface control module to pair to a Bluetooth ® device.
- Before performing this test, verify compatibility of the cellular phone(s) the customer is attempting to use with the vehicle. Based on the cellular phone's service provider and the manufacturer's implementation of Bluetooth ®, not all phones support all available Bluetooth ® functionality. A vehicle and feature compatibility list will be provided via the GM Bluetooth ® website:
<http://www.onstar.com/web/Bluetooth/>
- If the vehicle passes the following tests and a compatible device is being used, the concern may be due to a device malfunction or an incomplete/improper pairing attempt.
- A Bluetooth ® test tool or equivalent can also be used to verify the ability of the customers cellular phone (s) to pair with another device.

Satellite Antenna Circuit Short to Ground

DTC B125C 04

Satellite Antenna Circuit Open

Circuit/System Description

The digital radio receiver, located inside the radio, receives digital radio information from the digital radio antenna located on the outside of the vehicle. The digital radio receiver is connected to the digital radio antenna via a shielded coax cable. The digital radio antenna contains an amplifier which is powered by the radio through the coax cable.

Conditions for Running the DTC

This DTC is run every 300 milliseconds.

Conditions for Setting the DTC

The radio detects a circuit fault in the digital radio antenna.

Action Taken When the DTC Sets

The radio displays No XM Signal or Check Antenna.

Conditions for Clearing the DTC

- A current DTC clears when the condition for setting the DTC is no longer present.
- A history DTC clears after 100 malfunction-free ignition cycles.

Diagnostic Aids

The digital radio antenna requires a clear line of sight to the sky to operate properly. Reception may be limited, intermittent, or unavailable inside structures.

Special Tools

EL-48028 Digital Radio Test Antenna

Circuit/System Verification

1. With the vehicle outside in an area with an unobstructed view of the southern sky, tune to XM.
2. Verify DTC B125C is not set as current and the No XM Signal or Check Antenna message is not displayed on the radio.
 - **If DTC B125C is set as current or the No XM Signal or Check Antenna message is displayed.**

Refer to Circuit/System Testing.
 - **If DTC B125C is not set as current and the No XM Signal or Check Antenna message is not displayed.**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the digital radio antenna coax cable from the A11 radio. Connect the **EL-48028** digital radio test antenna to the radio and place on the roof of the vehicle.
2. Ignition ON, radio tuned to XM channel 1.

3. Verify DTC B125C is not set as current and XM reception is improved.

- **If DTC B125C is set as current or XM reception is not improved**

Replace the A11 radio.

- **If DTC B125C is not set as current and XM reception is improved**

4. Ignition OFF, disconnect the digital radio antenna coax cable from the T4D cellular phone, navigation, and digital radio antenna.

5. Verify the digital radio antenna coax cable passes the coax cable component test. Refer to Component Testing.

- **If the coax cable does not pass the test**

Replace the antenna coax cable

- **If the coax cable passes the test**

6. Replace the T4D cellular phone, navigation, and digital radio antenna.

Component Testing

CAUTION: Refer to Test Probe Caution .

NOTE: Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.

2. Test for less than 5 ohms between coax cable center terminal end to end.

- **If 5 ohms or greater**

Replace the coax cable

- **If less than 5 ohms**

3. Test for less than 5 ohms between the coax cable outer shield end to end.

- **If 5 ohms or greater**

Replace the coax cable

- **If less than 5 ohms**

4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
 - **If less than infinite resistance**

Replace the coax cable

- **If infinite resistance**
5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Radio Antenna Base Replacement**
- **Control Module References** for radio replacement, programming, and setup.

ONSTAR MICROPHONE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Microphone High Signal Terminal 9	B2455 02	B2455 04	B2455 04	-
Microphone Low Signal Terminal 10	B2455 02	B2455 04	B2455 04	-

Circuit/System Description

The telematics communication interface control module provides the Cellular Phone Microphone with a supplied voltage on the cellular phone microphone signal circuit. When the cellular phone microphone is in use, voice data from the user is sent back to the telematics communication interface control module on the signal circuit.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B2455 is not set.
 - **If DTC B2455 is set**

Refer to **DTC B2455, DTC B2455 (Radio)**.

- **If DTC B2455 is not set**
3. Verify that a successful OnStar voice command can be made.
 - **If your voice can not be heard clearly.**

Refer to Circuit/System Testing - Microphone Malfunction.

- **If your voice can be heard clearly**
4. All OK.

Circuit/System Testing

Microphone Malfunction

1. Ignition OFF, disconnect the harness connector at the B24 Cellular Phone Microphone, ignition ON.
2. Test for 8.0-10.5 V between the signal circuit terminal B and ground.
 - **If less than 8.0 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
 2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground in the circuit.
- If infinite resistance
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the vehicle K73 Telematics Communication Interface Control Module.
 - **If greater than 10.5 V**
- 1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
- 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
 - **If between 8.0-10.5 V**
- 3. Test for less than 1 V between the signal circuit terminal A and ground.
 - **If greater than 1 V**
- 1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
- 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, repair the K73 Telematics Communication Interface Control Module.
 - **If less than 1 V**
- 4. Test for greater than 8 V between the signal circuit terminal B and the signal circuit terminal A.
 - **If less than 8 V**
- 1. Ignition OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
- 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the vehicle K73 Telematics Communication Interface Control Module.
 - **If greater than 9 V**
- 5. Test or replace the B24 Cellular Phone Microphone.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

• **Mobile Telephone Microphone Replacement**

- **Control Module References** for radio or telematics communication interface control module replacement, programming, and setup.

ONSTAR AUDIO MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Audio High Signal terminal 1	1	1	1	-
Audio Low Signal terminal 2	1	1	1	-
1. No (or Noisy) OnStar® Audio				

Circuit/System Description

When an OnStar® keypress is made, a serial data message is sent to the audio system to mute all radio functions and output OnStar® originated audio. After the audio system is muted, the telematics communication interface control module transmits signals to the audio system on the audio signal and audio common circuits.

Circuit/System Verification

1. Ignition ON, radio ON.
2. Verify that audio is heard clearly through all speaker channels when tuning radio to a known good station.
 - **If audio is not heard clearly**

Refer to **Speaker Malfunction**

- **If audio is heard clearly**
- 3. Verify that the Connecting to OnStar® message is heard clearly through the audio system when the OnStar® blue button is pressed.
 - **If OnStar message is noisy or distorted**

Refer to Circuit/System Testing

- **If OnStar message is heard clearly**
- 4. All OK.

Circuit/System Testing

1. Ignition OFF and vehicle systems OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
2. Test for less than 4 V between each of the signal circuits listed below and ground:
 - Terminal 1
 - Terminal 2
 - **If 4 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio, ignition ON.
 2. Test for less than 1 V between the signal circuits and ground.
 - If greater than 1 V, repair the short to voltage in the circuit.
 - If less than 1 V, replace the A11 Radio.
 - **If less than 4 V**
3. Ignition OFF.
4. Test for infinite resistance between each of the signal circuits listed below and ground:
 - Terminal 1
 - Terminal 2
 - **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

5. Disconnect the X1 harness connector at the A11 Radio.
6. Test for less than 2 ohms in each of the signal circuits listed below end to end:
 - K73 Telematics Communication Interface Control Module Terminal 1 X2
 - K73 Telematics Communication Interface Control Module Terminal 2 X2
- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

7. Replace the K73 Telematics Communication Interface Control Module.
8. Verify that the Connecting to OnStar® message is heard clearly through the audio system when the OnStar® blue button is pressed.
 - **If audio is not heard clearly**

Replace the A11 Radio.

- **If audio is heard clearly**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

Control Module References for radio or telematics communication interface control module replacement, programming, and setup.

NO GLOBAL POSITIONING SYSTEM (GPS) RECEPTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The navigation antenna is connected to the Telematics Communication Interface Control Module. The module supplies 5 V to the antenna to power the internal amplifier through the center conductor of the antenna coax cable.

Diagnostic Aids

- The scan tool Telematics Communication Interface Control Module GPS signal parameter will display a Yes or No dependent upon whether or not the module sees an increment of the seconds transmitted by GPS signals to the Telematics Communication Interface Control Module. Upon entering this screen, the GPS signal title will initially display Yes, regardless of the presence of time increment, for at least 2 seconds, while the algorithm in the scan tool determines the status of the clock. If increment is found, Yes is continually displayed. If the clock remains static, No is displayed. The scan tool looks for increment every second, regardless of current display.
- Inaccurate or aged GPS position concerns which are no longer present may have been due to the temporary loss of GPS signal reception by the vehicle. Conditions such as tunnels or parking structures will restrict the cellular phone and navigation antenna from a clear view of the satellites in the sky and may have caused this temporary data loss.
- The GPS requires a clear line of sight to the sky to operate properly. In most cases the GPS will not have reception near tall buildings or inside structures.

Circuit/System Verification

NOTE: **The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 minutes after turning the ignition ON for the vehicle to acquire the GPS satellites signal.**

1. Ignition ON.

2. Verify that no DTCs are set.

- **If any DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are set**

3. Verify that an OnStar advisor can locate the vehicle after performing a blue button press.

- **If the advisor can not locate the vehicle**

Refer to Circuit System Testing.

- **If the advisor can locate the vehicle**

4. All OK.

Circuit/System Testing

NOTE: **The global positioning system (GPS) requires a clear line of sight to the sky to operate properly. It may take up to 15 minutes for the Nav Radio to acquire a GPS signal. In most cases the GPS will not have reception near tall buildings or inside structures.**

1. Ignition OFF, disconnect the GPS and cellular coax cable connector at the K73 Telematics Communication Interface Control Module.

2. Using the **EL-49903** OnStar Antenna Diagnostic Tool Kit, connect the EL-49903-3 antenna to the K73 telematics communication interface module. Place the test antenna on the roof of the vehicle, ignition ON.

3. Verify that an OnStar advisor can locate the vehicle after performing a blue button press.

- **If the advisor can not locate the vehicle**

Replace the K73 Telematics Communication Interface Control Module.

- **If the advisor can locate the vehicle**

4. Test the coax cable between the K73 Telematics Communication Interface Control Module and the T4G Cellular Phone, Navigation, and Digital Radio Antenna. Refer to component testing.

- **If the coax cable does not pass the test**

Replace the coax cable.

- **If the coax cable passes the test**

5. Test or replace the T4G Cellular Phone, Navigation, and Digital Radio Antenna.

Component Testing

CAUTION: Refer to **Test Probe Caution** .

NOTE:

- Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.
- To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.
- The vehicle may be equipped with sectioned coax. Test each section and replace only the faulty section, not the entire length of coax.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 ohms between the coax cable center terminal end to end.
 - **If 5 ohms or greater**

Replace the coax cable.

- **If less than 5 ohms**

3. Test for greater than 5 ohms between the coax cable outer shield end to end.
 - **If 5 ohms or greater**

Replace the coax cable.

- **If less than 5 ohms**

4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
 - **If less than infinite resistance**

Replace the coax cable.

- **If infinite resistance**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

1. OnStar® LED Inoperative 2. LED Illuminated At All Times 3. OnStar® Buttons Inoperative				

Circuit Description

The OnStar® status LEDs are located with the OnStar buttons. The green LED is illuminated when the system is ON and operating normally. When the green LED is green and flashing, it is an indication that a call is in progress. When the red LED is illuminated, a system malfunction is present. In the event there is a system malfunction and the OnStar® system is still able to make a call, the LED will flash red during the call. The OnStar® LEDs are controlled by the telematics communication interface control module via the keypad green LED signal circuit and the keypad red LED signal circuit.

Circuit/System Verification

NOTE: If the green LED is off with the ignition ON and the LED does not function when commanded with the scan tool, contact the OnStar Center to confirm the vehicle has a current subscription.

1. Ignition ON.
2. Verify that the green LED turns ON and OFF when commanding the K73 telematics communication interface control module green indicator ON and OFF with a scan tool.
 - **If the green LED does not turn ON and OFF**

Refer to Circuit/System Testing - Green LED Test

- **If the green LED turns ON and OFF**
- 3. Verify that the red LED turns ON and OFF when commanding the K73 telematics communication interface control module red indicator ON and OFF with a scan tool.
 - **If the red LED does not turn ON and OFF**

Refer to Circuit/System Testing - Red LED Test

- **If the red LED turns ON and OFF**
- 4. All OK.

Circuit/System Testing

NOTE:

- **10 V reference circuit measurement may vary with vehicle battery voltage.**
- **Test for voltage range with vehicle battery measuring at a minimum of 11.5 V**

Green LED Test

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal E and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**
- 3. Ignition ON.
- 4. Test for less than 1 V between the control circuit terminal F and ground while commanding the Green Indicator OFF with a scan tool.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, Ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
 - **If less than 1 V**
- 5. Test for greater than 8 V between the control circuit terminal F and ground while commanding the Green Indicator ON with a scan tool.
 - **If 8 V or less**
 1. Ignition OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K73 Telematics Communication Interface Control Module.
 - **If greater than 8 V**
- 6. Test or replace the A10 Inside Rearview Mirror.

Red LED Test

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal E and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for less than 1 V between the control circuit terminal G and ground while commanding the Red Indicator OFF with a scan tool.
 - **If 1 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, Ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
- **If less than 1 V**
5. Test for greater than 8 V between the control circuit terminal G and ground while commanding the Red Indicator ON with a scan tool.
 - **If 8 V or less**
 - 1. Ignition OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K73 Telematics Communication Interface Control Module.
 - **If greater than 8 V**
6. Test or replace the A10 Inside Rearview Mirror.

ONSTAR CALL CENTER REMOTE FUNCTION REQUESTS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The telematics communication interface control module has the capability of commanding the horn, initiating door lock/unlock, or operating the exterior lamps using the serial data circuits. These functions are commanded by the OnStar® Call Center per a customer request.

Diagnostic Aids

The customer concern may have been due to a lack of cellular service in a given area, or a failure in the National Cellular Network infrastructure that has since been corrected.

Circuit/System Verification

NOTE:

- It is necessary to inform the OnStar® Call Center advisor that this call is for vehicle diagnostic purposes.
- It is necessary to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.

1. Ignition ON.
2. Verify that the horn, lights, and the door locks on the vehicle operate properly.
 - **If an applicable vehicle system does not operate properly**

Refer to **Diagnostic System Check - Vehicle** .

- **If all applicable vehicle systems operate properly**
3. Verify that a call can be successfully placed to the OnStar Call Center by pressing the blue OnStar button.
 - **If unable to contact the OnStar® call center**

Refer to **Unable to Contact OnStar Call Center**

- **If able to contact the OnStar Call Center**

4. Verify with the OnStar advisor that all remote functions (door locks, lights, and horn) work.

- **If the remote functions do not operate when requested**

Replace the K73 Telematics Communication Interface Control Module

- **If the remote functions operate when requested**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
10 V Reference	1	B2476 04	B2476 04	-
Signal Terminal B	B2476 04	B2476 04	B2476 59	B2476 59, B2482 00
Ground	-	B2476 04	-	-
1. OnStar® LED Inoperative				

Circuit/System Description

The OnStar® button assembly consists of 3 buttons: Call/Answer, OnStar® Call Center, and OnStar® Emergency. The telematics communication interface control module supplies the OnStar® button assembly with 10 V via the keypad supply voltage circuit. Each of the buttons, when pressed, completes the circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module over the keypad signal circuit. Depending upon the voltage range returned, the telematics communication interface control module is able to identify which button has been activated.

Circuit/System Verification

NOTE: **Contact the OnStar® Call Center first before pressing the emergency button in order to notify them of the test.**

1. Ignition ON.
2. Verify that each button of the S51 telematics button assembly operates normally by pressing each button individually.
 - **If none of the buttons operate normally**

Refer to Circuit/System Testing.
 - **If some, but not all, of the buttons operate normally**

Test or replace the A10 Inside Rearview Mirror.
 - **If all of the buttons operate normally**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 15 ohms between the ground circuit terminal E and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Test for 9.5-10.5 V between the 10 V reference circuit terminal A and ground.
 - **If less than 9.5 V**
 1. Ignition OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module.
 2. Test for infinite resistance between the 10 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 10 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K73 Telematics Communication Interface Control Module.
 - **If greater than 10.5 V**
 1. Ignition OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
 2. Test for less than 1 V between the 10 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
 - **If between 9.5-10.5 V**
5. Ignition OFF.
6. Test for 500-900 ohms between the signal circuit terminal B and ground.
 - **If less than 500 ohms**
 1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K73 Telematics Communication Interface Control Module.
 - **If greater than 900 ohms**
 1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V
- 3. Ignition OFF.
- 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K73 Telematics Communication Interface Control Module.
- **If between 500-900 ohms**
- 7. Test or replace the A10 Inside Rearview Mirror.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Inside Rearview Mirror Replacement**
- **Control Module References** for telematics communication interface control module replacement, programming and setup.

ONSTAR STEERING WHEEL CONTROL FUNCTIONS MALFUNCTION

Some vehicles equipped with the OnStar® system have the capability of accessing voice mailboxes and other automated phone systems by means of the steering wheel controls, while the OnStar® Personal Calling feature is in use. If the "Talk" or "Mute" button (depending upon the vehicle) on the steering wheel controls is depressed during an OnStar® Personal Calling call, the telematics communication interface control module receives the message on the serial data bus from either the radio or body control module. This message is interpreted as a request to turn any spoken numbers into dual tone multi-frequency tones to be delivered over the airwaves to the phone system the user is communicating with. Complete instructions for operation of these features can be found in the information provided to the customer with the OnStar® system.

The steering wheel controls are a resistor network that consist of multiple momentary contact switches and a series of resistors. The switches and resistor network are arranged so that each switch has a different resistance value. When a switch is pressed, a voltage drop occurs in the resistor network, which produces a specific voltage value unique to the switch selected, to be interpreted by either the radio or BCM. In the event the OnStar® steering wheel control functions are inoperative, technicians should refer to **Steering Wheel Controls Malfunction** , to begin diagnosis of the steering wheel control concern.

RADIO POOR RECEPTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B125A 02

Antenna Signal Circuit Short to Ground

DTC B125A 04

Antenna Signal Circuit Open Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Radio Antenna Coax	B125A 02	B125A 04	1	-
Ground	-	1	-	-
1. May exhibit possible AM/FM interference.				

Circuit/System Description

The multi-band antenna is located on the roof of the vehicle. The radio antenna is enabled when the radio is turned on. The radio provides battery voltage to the antenna using the center conductor of the antenna coaxial cable. When a 12 V signal is seen on the center conductor of the antenna coax, both AM and FM signals are amplified.

Conditions for Running the DTC

- Ignition ON.
- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B125A 02

The radio detects a short to ground in the antenna signal circuit center conductor.

B125A 04

The radio detects an open in the antenna signal circuit center conductor.

Action Taken When the DTC Sets

Radio reception may be poor or not available.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles have occurred.

Description and Operation

Radio/Audio System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, A11 Radio ON.
2. Verify station reception is normal when tuned to several known good AM and FM stations.
 - **If AM or FM reception is poor.**

Refer to Circuit/System Testing
 - **If reception is normal**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the radio antenna coax cable from the A11 Radio and from the T4M Radio Antenna.
2. Verify the antenna coax cable passes the coax cable component test. Refer to Component Testing.
 - **If the coax cable does not pass the test**

Replace the antenna coax cable
 - **If the coax cable passes the test**
3. Connect the radio antenna coax cable to the A11 Radio.

4. Ignition ON, A11 Radio ON.
5. Verify a test lamp illuminates between the antenna coax cable center terminal at the T4M Radio Antenna and chassis ground.
 - **If the test lamp does not illuminate**

Replace the A11 Radio.
 - **If the test lamp illuminates**
6. Test or replace the T4M Radio Antenna.

Component Testing

CAUTION: Refer to Test Probe Caution .

NOTE: Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 ohms between coax cable center terminal end to end.
 - **If 5 ohms or greater**

Replace the coax cable
 - **If less than 5 ohms**
3. Test for less than 5 ohms between the coax cable outer shield end to end.
 - **If 5 ohms or greater**

Replace the coax cable
 - **If less than 5 ohms**
4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
 - **If less than infinite resistance**

Replace the coax cable
 - **If infinite resistance**

5. All OK.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Front Speaker Output Signal	B1025 02, 1	B1025 04, 1	B1025 01, 1, 2	-
Right Front Speaker Output Signal	B1035 02, 1	B1035 04, 1	B1035 01, 1, 2	-
Left Rear Speaker Output Signal	B1045 02, 1	B1045 04, 1	B1045 01, 1, 2	-
Right Rear Speaker Output Signal	B1055 02, 1	B1055 04, 1	B1055 01, 1, 2	-
1. No or reduced audio from speaker(s) on the affected audio circuit. 2. Noticeable audio distortion may be present.				

Circuit/System Description

Each of the audio output channel circuits (+) and (-), at the radio have a DC bias voltage that is approximately one half of battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5 V DC. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to

move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Diagnostic Aids

- Improper speaker mounting or loose trim may cause an audible buzz or distortion. Inspect the appropriate speaker and the surrounding interior trim for proper and secure mounting.
- The EL-50334-6 Audio System Diagnostic CD contains audio tracks that can be used to duplicate and isolate such concerns. Tracks 11 and 12 contain audio sweep tones for testing for speaker and grill rattles.
- The test tones on the CD may be copied to a USB drive or other device to use during testing.
- If the speaker or surrounding interior trim is found to be loose or improperly secured, correctly secure the item.

EL-50334-50 USB Cable and Adapter Kit

Circuit/System Verification

1. Ignition ON, A11 Radio ON, mute OFF.

2. Verify clear audio is heard from each speaker, adjusting fade and balance controls to test each speaker individually.

- **If audio is inoperative from one or more speakers, or the audio emitted is not clear**

Refer to Circuit/System Testing.

- **If clear audio is heard from all speakers**

3. All OK.

Circuit/System Testing

NOTE: Some circuits supply audio signals to more than one speaker. It may be necessary to disconnect all speakers on the affected audio circuit when performing circuit tests.

1. Ignition OFF, disconnect the harness connector at the appropriate P19 Speaker. Ignition ON, radio ON, mute OFF.
2. Test for 5-7 V between each audio signal circuit terminal 1 and terminal 2 and ground.

- **If less than 5 V**

1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the A11 Radio.

- **If greater than 7 V**

1. Ignition OFF, disconnect the X1 harness connector at the A11 Radio. Ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the A11 Radio.

- **If between 5-7 V**

NOTE: In the following tests, audio signal frequencies (Hz) will be tested. To prevent misdiagnosis, the door chime must be OFF during testing. Ensure the driver door latch is closed during testing.

3. Insert the EL-50334-6 Audio Test CD from the **EL-50334-50** USB cable and adapter kit. Play track number three (50 Hz bass test tone) from the test CD.
4. Test for 49-51 Hz between each signal circuit terminal 1 and terminal 2 and ground.
 - **If not between 49-51 Hz**

Replace the A11 Radio.

- **If between 49-51 Hz**

5. Test or replace the P19 Speaker.

UNABLE TO CONTACT ONSTAR CALL CENTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The telematics communication interface control module is a cellular device that allows the user to communicate data and voice signals over the national cellular network. When an OnStar keypress is made, the telematics communication interface control module activates and connects the system to the cellular carriers communication system by interacting with the national cellular infrastructure. The module sends and receives all cellular communications over the cellular phone and navigation antenna and cellular antenna coax.

Diagnostic Aids

- The customer concern may have been due to a lack of cellular service in a given area. A failure in the National Cellular Network infrastructure at the time of the customers failed connection that has since been repaired may also have been the cause.
- If an OnStar® emergency call is able to successfully connect the vehicle to the OnStar® Call Center when an OnStar® Call Center button press is not, there may be a failure in the ability of the OnStar® system in the vehicle to be recognized by the local cellular carrier.
- If the prompt "OnStar® request ended" is heard, without pressing the white dot button at the end of the OnStar® keypress, the OnStar® system at one time has made a successful cellular connection, but was unable to complete the call.
- It is important to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.

Circuit/System Verification

NOTE: **The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 min after turning the ignition ON for the GPS satellites to acquire vehicle signal.**

1. Ignition ON.
2. Verify that DTC B2470 is not set.
 - **If DTC B2470 is set**

Refer to **DTC B2470**
 - **If DTC B2470 is not set**
3. Verify that a call can be successfully placed to the OnStar Call Center by pressing the blue OnStar button.
 - **If unable to connect with the OnStar Call Center.**

Refer to Circuit/System Testing

- **If able to connect with the OnStar Call Center**
4. All OK.

Circuit/System Testing

NOTE:

- The vehicle may be equipped with sectioned coax. Test each section and replace only the faulty section, not the entire length of coax.
- The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 min after turning the ignition ON for the GPS satellites to acquire vehicle signal.

1. Ignition OFF and all vehicle systems OFF, disconnect the GPS and cellular coax cable connector at the K73 Telematics Communication Interface Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Using the EL-49903-3 kit (EL-49903-5 adapter and EL-49903-4 coax cable), connect the **EL-49903** GM OnStar antenna diagnostic tool kit to the K73 Telematics Communication Interface Control Module.
3. Ignition ON, wait 5 min.
4. Verify that a call can be successfully placed to the OnStar Call Center by pressing the blue OnStar button.
 - **If unable to connect with the OnStar Call Center**

Test or replace the K73 Telematics Communication Interface Control Module.

- **If able to connect with the OnStar Call Center**

5. Ignition OFF, disconnect the **EL-49903** GM OnStar antenna diagnostic tool kit from the K73 Telematics Communication Interface Control Module
6. Test the coax cable between the K73 Telematics Communication Interface Control Module and the T4G Cellular Phone, Navigation, and Digital Radio Antenna. Refer to Component Testing.
 - **If the coax cable does not pass the test**

Replace the coax cable.

- **If the coax cable passes the test**

7. Test or replace the T4G Cellular Phone, Navigation, and Digital Radio Antenna.

Component Testing

CAUTION: Refer to Test Probe Caution .

NOTE:

Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 ohms between the coax cable center terminal end to end.
 - **If 5 ohms or greater**

Replace the coax cable.
 - **If less than 5 ohms**
3. Test for greater than 5 ohms between the coax cable outer shield end to end.
 - **If 5 ohms or greater**

Replace the coax cable.
 - **If less than 5 ohms**
4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
 - **If less than infinite resistance**

Replace the coax cable.
 - **If infinite resistance**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Radio Antenna Base Replacement**
- **Control Module References** for telematics communication interface control module replacement, programming, and setup.

ONSTAR VOICE RECOGNITION MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The telematics communication interface control module is capable of interpreting voice commands received over the cellular microphone circuit. Speech recognition allows the user to speak to one computer in the vehicle, and one reached over the cellular communication network. The module attempts to understand the users command, and responds by speaking back, or by taking the appropriate action, e.g. dialing the phone.

Mobile Telephone Microphone Replacement

Callout	Component Name
Preliminary Procedure Remove the center courtesy lamp. Refer to <u>Center Courtesy Lamp Replacement</u> .	
1	Dome Lamp Housing Fastener (Qty: 5) CAUTION: Refer to <u>Fastener Caution</u> .

2	Dome Lamp Housing
3	Mobile Telephone Microphone

COMMUNICATION INTERFACE MODULE REPLACEMENT

Fig. 6: Communication Interface Module
Courtesy of GENERAL MOTORS COMPANY

Communication Interface Module Replacement

Callout	Component Name
WARNING: Refer to <u>Battery Disconnect Warning</u> .	
Preliminary Procedures	
1. Disconnect the battery negative cable. 2. Remove driver front seat. Refer to <u>Driver or Passenger Seat Removal and Installation</u> .	
1	Communication Interface Module Fastener (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 10 (89 lb in)

2

Communication Interface Module

Procedure

Disconnect the electrical connector.

COMMUNICATION INTERFACE MODULE BATTERY REPLACEMENT**Fig. 7: Communication Interface Module Battery**

Courtesy of GENERAL MOTORS COMPANY

Communication Interface Module Battery Replacement

Callout	Component Name
WARNING: Refer to <u>Battery Disconnect Warning</u> .	
Preliminary Procedures	
1. Disconnect the battery negative cable. 2. Remove passenger front seat. Refer to <u>Driver or Passenger Seat Removal and Installation</u> .	
1	Communication Interface Module Battery Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 9 (80 lb in)

Procedure

Disconnect the electrical connector.

COMPACT DISC CARE AND CLEANING**Care of CDs**

Handle CDs carefully. Store them in their original cases or other protective cases and away from direct sunlight and dust. The CD player scans the bottom surface of the disc. If the surface of a CD is damaged, such as cracked, broken, scratched, or wrinkled labeling, the CD will not play properly or not at all. If the surface of a CD is soiled, take a soft, lint free cloth or dampen a clean, soft cloth in a mild, neutral detergent solution mixed with water, and clean it. Make sure the wiping process starts from the center to the edge. Do not touch the bottom side of a CD while handling it. This could damage the surface. Pick up CDs by grasping the outer edges or the edge of the hole and the outer edge.

Care of CD Player

The use of CD lens cleaners for CD players is not advised, due to the risk of contaminating the internal lens of the CD optics with lubricants.

Stuck CDs

Interrupting the battery power by pulling the fuse will sometimes release a stuck CD. If a CD is stuck, and removed, inspect it for warps, cracks, etc. If the CD is damaged, do not replace the radio.

Labelling CDs

Paper labels can eventually warp and wrinkle, and this will cause the disc to jam inside the CD player. Try labeling the top of the discs with a soft magic marker instead.

RADIO REPLACEMENT

Fig. 8: Radio Assembly
Courtesy of GENERAL MOTORS COMPANY

Radio Replacement

Callout	Component Name
WARNING: Refer to <u>Battery Disconnect Warning</u> .	
Preliminary Procedures	
1. Disconnect the battery negative cable. 2. Remove I/P center molding. Refer to <u>Instrument Panel Center Molding Replacement</u> .	
1	Radio Screw (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 (27 lb in)
2	Radio Assembly Procedure 1. Disconnect electrical components.

2. After replacement, refer to **Control Module References** for programming and setup information.

RADIO ANTENNA BASE REPLACEMENT

Fig. 9: Radio Antenna Base
Courtesy of GENERAL MOTORS COMPANY

Radio Antenna Base Replacement

Callout	Component Name
Preliminary Procedures Remove the dome lamp. Refer to .	
1	Radio Antenna Base Nut CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 N.m (27 lb in)
2	Radio Antenna Base Procedure

1. Disconnect electrical connector.
2. Remove the antenna base from the roof panel.

RADIO FRONT SPEAKER REPLACEMENT

Fig. 10: Radio Front Speaker

Courtesy of GENERAL MOTORS COMPANY

Radio Front Speaker Replacement

Callout	Component Name
1	Radio Front Speaker Cover
2	Radio Front Speaker Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 N.m (27 lb in)
3	Radio Front Speaker

USB RECEPTACLE REPLACEMENT

Fig. 11: USB Receptacle
 Courtesy of GENERAL MOTORS COMPANY

USB Receptacle Replacement

Callout	Component Name
1	USB Receptacle and Cover Procedure Remove the USB receptacle cover from the instrument panel by pushing out the taps behind the cover.
2	USB Receptacle Procedure Remove the USB receptacle from the cover.

RADIO REAR QUARTER TRIM PANEL SPEAKER REPLACEMENT

Fig. 12: Radio Rear Quarter Trim Panel Speaker
 Courtesy of GENERAL MOTORS COMPANY

Radio Rear Quarter Trim Panel Speaker Replacement

Callout	Component Name
1	Radio Rear Speaker Screw (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 N.m (27 lb in)
2	Radio Rear Quarter Trim Panel Speaker

DESCRIPTION AND OPERATION

ONSTAR DESCRIPTION AND OPERATION

This OnStar® system consists of the following components:

- Telematics communication interface control module
- OnStar® three button assembly
- Microphone

- Cellular antenna
- Navigation antenna
- Bluetooth® antenna (If equipped)
- Back up battery (If equipped)

This system also interfaces with the factory installed vehicle audio system.

Telematics Communication Interface Control Module

The telematics communication interface control module is a cellular device that allows the user to communicate data and voice signals over the national cellular network. Power is provided by a dedicated, fused B+ circuit. Ground is provided through the vehicle wiring harness attached to the module. The ignition state is determined by the telematics communication interface control module through serial data messaging.

Dedicated circuits are used to connect the telematics communication interface control module to a microphone, the button assembly, and to command the status LED. The telematics communication interface control module communicates with the rest of the vehicle over the serial data bus.

The module houses 2 technology systems, one to process GPS data, and another for cellular information. The cellular system connects the OnStar® system to the cellular carrier's communication system by interacting with the national cellular infrastructure. The module sends and receives all cellular communications over the cellular antenna and cellular antenna coax. GPS satellites orbiting earth are constantly transmitting signals of their current location. The OnStar® system uses the GPS signals to provide location on demand.

The module also has the capability of activating the horn, initiating door lock/unlock, or activating the exterior lamps using the serial data circuits. These functions can be commanded by the OnStar® Call Center per a customer request.

OnStar® Three Button Assembly

Base Mirror

- The OnStar® button assembly may be part of the rearview mirror, or a separate, stand alone unit. The button assembly is comprised of 3 buttons and a status LED. The buttons are defined as follows:
 - The answer/end call button, which is black with a white phone icon, allows the user to answer and end calls or initiate speech recognition.
 - The blue OnStar® call center button, which displays the OnStar® logo, allows the user to connect to the OnStar® call center.
 - The emergency button, which displays a white cross with a red background, sends a high priority

emergency call to the OnStar® call center when pressed.

The telematics communication interface control module supplies 10 volts to the OnStar® button assembly on the keypad supply voltage circuit. When pressed, each button completes a circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module on the keypad signal circuit. Depending upon the voltage range returned the telematics communication interface control module is able to identify which button has been pressed.

The OnStar® status LED is located with the button assembly. The LED is green when the system is ON and operating normally. When the status LED is green and flashing, it is an indication that a call is in progress. When the LED is red, this indicates a system malfunction is present. In the event there is a system malfunction and the OnStar® system is still able to make a call, the LED will flash red during the call.

If the mirror has the rear vision camera display in the mirror, the LED's are then interior to the mirror and controlled via data communication on the Low Speed GMLAN bus from the Telematics Communication Interface Control Module to the mirror.

If the LED does not illuminate, this may indicate that the customers OnStar® subscription is not active or has expired. Push the blue OnStar button to connect to an advisor who can then verify the account status.

Each LED is controlled by the telematics communication interface control module over dedicated LED signal circuits. Ground for the LED is provided by the wiring harness attached to the button assembly.

Prismatic Mirror (If Equipped)

- The OnStar® button assembly is apart of the rearview mirror. The button assembly is comprised of 3 capacitive touch buttons and a status LED. The buttons are defined as follows:
 - The answer/end call button, which is a white driver figure seated with voice signals near it's face, allows the user to answer and end calls or initiate speech recognition.
 - The blue OnStar® call center button, which displays the blue OnStar® logo, allows the user to connect to the OnStar® call center.
 - The emergency button, which displays red letters "SOS" as an illuminated Indicator, sends a high priority emergency call to the OnStar® call center when pressed.

The telematics communication interface control module supplies 10 volts to the OnStar® button assembly on the keypad supply voltage circuit. When pressed, each button press is processed and completes a circuit across an internal resistor allowing a specific voltage to be returned to the telematics communication interface control module on the keypad signal circuit. Depending upon the voltage range returned the telematics communication interface control module is able to identify which button has been pressed.

The OnStar® status LED is located within the mirror near the buttons. The LED is green when the system is ON and operating normally. When the status LED is green and flashing, it is an indication that a call is in progress. When the LED is red, this indicates a system malfunction is present. In the event there is a system malfunction and the OnStar® system is still able to make a call, the LED will flash red during the call.

If the LED does not illuminate, this may indicate that the customers OnStar® subscription is not active or has expired. Push the blue OnStar button to connect to an advisor who can then verify the account status.

Each LED is controlled by the telematics communication interface control module over dedicated LED signal circuits. Ground for the LED is provided by the wiring harness attached to the button assembly.

Electrochromic Mirror (If Equipped)

- The OnStar® button assembly is apart of the rearview mirror. The button assembly is comprised of 3 capacitive touch buttons and an error indicator. The buttons are defined as follows:
 - The answer/end call button, which is a white driver figure seated with voice signals near it's face, allows the user to answer and end calls or initiate speech recognition.
 - The blue OnStar® call center button, which displays the blue OnStar® logo, allows the user to connect to the OnStar® call center.
 - The emergency button, which displays red letters "SOS" as an illuminated Indicator, sends a high priority emergency call to the OnStar® call center when pressed.

The telematics communication interface control module supplies 10 volts to the OnStar® button assembly on the keypad supply voltage circuit. When pressed, each button press is processed and completes a circuit across an internal resistor allowing a specific voltage to be returned to the telematics communication interface control module on the keypad signal circuit. Depending upon the voltage range returned the telematics communication interface control module is able to identify which button has been pressed and illuminate associated indicator above each button.

The OnStar® error indicator is located within the mirror above the buttons between the OnStar® indicator and emergency "SOS" indicator. All three indicators associated with a button press are illuminated when the system is ON and operating normally. When any indicator is illuminated and flashing, it is an indication that a call is in progress. When the OnStar® error indicator is illuminated, this indicates a system malfunction is present. In the event there is a system malfunction and the OnStar® system is still able to make a call, the OnStar® error indicator will remain illuminated during the call.

If the indicators do not illuminate, this may indicate that the customers OnStar® subscription is not active or has expired. Push the blue OnStar button to connect to an advisor who can then verify the account status.

Secondary OnStar® Controls

Some vehicles may have an additional button that when pushed can engage the OnStar® system. The button may be a symbol of a face with sound waves, or may say MUTE, or be a symbol of a radio speaker with a slash through it.

By engaging the OnStar® system with this feature, the user can interact with the system by use of voice commands. A complete list of these commands is supplied in the information provided to the customer. If the information is not available for reference, at any command prompt the user can say "HELP" and the telematics communication interface control module will return an audible list of available commands.

OnStar® Microphone

The OnStar®, or cellular microphone, can be a part of the rearview mirror assembly, or on some vehicle lines, a separate, stand alone unit. In either case, the telematics communication interface control module supplies approximately 10 volts to the microphone on the cellular microphone signal circuit, and voice data from the

user is sent back to the telematics communication interface control module over the same circuit. A cellular microphone low reference circuit or a drain wire provides a ground for the microphone.

Cellular and GPS Antennas

This vehicle will be equipped with one of the following types of antennas:

- A combination cellular and navigation antenna, which brings the functions of both into a single part
- A cellular, GPS, and digital radio receiver antenna, which also incorporates the functionality of the digital radio receiver satellite antenna (XM).
- A cellular, GPS, and digital radio receiver antenna, which also incorporates the AM/FM antenna.

The cellular antenna is the component that allows the OnStar® system to send and receive data over airwaves by means of cellular technology. The antenna is connected at the base to a coax cable that plugs directly into the telematics communication interface control module.

The GPS antenna is used to collect the signals of the orbiting GPS satellites. Within the antenna is housed a low noise amplifier that allows for a more broad and precise reception of this data. The antenna is connected at the base to a coax cable that plugs directly into the telematics communication interface control module. The cable also provides a path for DC current for powering the antenna.

The OnStar® Call Center also has the capability of communicating with the vehicle during an OnStar® call to retrieve the latest GPS location and transmit it to the OnStar® Call Center. A history location of the last recorded position of the vehicle is stored in the module and marked as aged, for as long as the module power is not removed. Actual GPS location may take up to 10 minutes to register in the event of a loss of power.

OnStar® RemoteLink

OnStar® RemoteLink is a mobile app to link mobile devices to a vehicle for limited diagnostics and feature controls. After downloading the app and registering the device, vehicle owners with an eligible vehicle can use their mobile devices to access real-time data from their vehicle and perform specific commands remotely.

All communication between the app and the vehicle is powered by OnStar's® advanced connected vehicle technology. An active OnStar® account as well as a valid OnStar® username and password are required to use the app. The remote commands must be enabled by logging into the user's OnStar® account prior to using the app.

Vehicle Control Features

- Lock/Unlock doors
- Start vehicle remotely
- Activate your Horn & Lights
- Contact an OnStar Advisor, Roadside Assistance or your Preferred Dealer

Available Vehicle Data:

- Real-time fuel information, including fuel range, fuel remaining, and lifetime MPG
- Lifetime mileage
- Remaining oil life
- Current tire pressure information
- OnStar® account information

Compass Heading

The telematics communication interface module has a compass feature to calculate vehicle direction which is displayed via the instrument panel cluster or designated display. The compass heading is determined by dead reckoning until the GPS 3d fix is established. The dead reckoning is accomplished by using the yaw rate sensors and wheel ticks to determine heading changes from a GPS known heading. The GPS 3d fix heading is determined by the differential of two locations.

Bluetooth® (If Equipped)

Bluetooth® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. Only vehicles with steering wheel controls will have Bluetooth® functionality. In order to utilize the vehicle's Bluetooth® system, a Bluetooth® equipped cellular phone is required.

The Bluetooth® antenna is a small fixed antenna connected directly to the telematics communication interface control module and is used to send and receive signals from a Bluetooth® enabled cellular phone. The antenna utilizes no cabling and is not external to the vehicle. The available features and functions are determined by the software within the device being used and the telematics communication interface control module. The operating range of the signal from the vehicle is approximately 30 feet. Note that the operating range is dependent upon the cellular phone being used and battery level of the phone.

With Bluetooth® technology customers can experience hands-free calling as their Bluetooth® capable cellular phones are wirelessly connected to the vehicle. It will allow customers to place and receive calls using the steering wheel controls and voice recognition. The vehicle audio system will allow you to listen to your call through the vehicle speakers and adjust volume through steering wheel or radio controls.

Not all Bluetooth® cellular phones are guaranteed to work with the vehicle's Bluetooth® system. Based on the cellular phone's service provider and the manufacturer's implementation of Bluetooth®, not all phones support all available Bluetooth® functionality. Bluetooth® enabled cellular phones will be tested for vehicle compatibility and a feature compatibility list will be provided via the GM Bluetooth® website:
<http://www.gm.com/vc/bluetooth/>

Bluetooth® Features Supported

The following is a list of features supported by the Bluetooth® system. Note that not all devices will support all of the listed functions.

- Automatic reconnection - highest priority phone will automatically be connected to vehicle when vehicle ignition is on

- Hands-free dialing- via digits, redial, name tags (phone number saved to a nametag via voice recognition)
- Answering a call
- Ending a call
- Mute a Call
- Rejecting a call - ignore an incoming call
- Call Waiting
- Three-way Calling - initiated from hands-free system
- Send Number During a Call - this is used when calling a menu-driven phone system
- Transfer a Call - transfer call from vehicle to cellular phone and visa versa
- Voice Pass-Thru - allow access to the voice recognition commands on the cellular phone

Pairing a Bluetooth® Cellular Phone to the Vehicle

In order to use hands-free calling, the cellular phone must be paired to the vehicle. Up to five devices can be paired to the vehicle at one time, but only one can be connected at any given time. To pair a phone, the customer must know how to operate the Bluetooth® functionality of their phone. The pairing process must only be done one time for each phone, unless that phone's information is deleted. For safety reasons, the pairing process is disabled while the vehicle is moving.

Once the Bluetooth® cellular phone has been paired with vehicle, it will automatically connect to the vehicle when the ignition is on and the device is on. When more than one paired phone is in the vehicle, the phone with the highest priority will be connected. If the cellular phone is in use while getting into the vehicle, the phone can be switched to hands-free mode with the press of a button. In addition, a call in progress can be transferred from the vehicle hands-free mode to the phone to continue the call as the customer exits the vehicle.

Complete pairing instructions are provided in the Vehicle Owners Manual.

Back-up Battery (If Equipped)

IMPORTANT: Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Disconnecting power to the OnStar® module in any way while the ignition is ON or with retained accessory power activated may cause activation of the OnStar® Back-Up Battery. This action is per design as the back-up battery is designed to provide power to the telematics communication interface control module so an emergency notification call can be made after an event where the main battery is disabled. Once the Back-Up Battery is activated it will stay on until the power is restored back to the telematics communication interface control module. The telematics communication interface control module naturally chooses the main supply voltage as it's default supply, but if the main supply is removed or lost for any reason the OnStar® module will use the Back-Up Battery as a power supply as long as the default supply can not be detected. The back-up battery is not rechargeable and once discharged below 9.5 volts the back-up battery must be replaced.

Certain OnStar® equipped vehicles may also be equipped with a back-up battery. The back-up battery is a non-rechargeable, lithium battery intended to provide an auxiliary power source for the telematics communication interface control module in the event where power from the main vehicle battery is lost.

The back-up battery is intended to have a limited life span of approximately 4 years and is designed to maintain an open circuit voltage between 16 V and 9 V throughout this period. This allows the battery to power the basic functions of the telematics communication interface control module for least one 200 second (5 minute) call at the end of the 4 year span, should the main vehicle battery be lost. In the case of a vehicle losing vehicle battery power, OnStar will switch over to the backup battery based on an internal algorithm. It will look for an air-bag deploy, or near-deploy, messages from the SDM. If there are no messages the OnStar module will stay wake for a few minutes longer and monitor the buttons in the mirror. If not pressed, the modules will power down and shut off completely.

The back-up battery is connected to the telematics communication interface control module through the back-up battery positive voltage circuit and back-up battery ground circuit and is protected from a short circuit by means of an internal fuse. In the event the back-up battery, battery positive voltage circuit is shorted to the back-up battery ground circuit or chassis ground, the fuse will open and render the back-up battery permanently inoperable. The status of the back-up battery and its associated wiring is monitored by the telematics communication interface control module.

Audio System Interface

When the OnStar® requires audio output, a serial data message is sent to the audio system to mute all radio functions and transmit OnStar® originated audio. The OnStar® audio is transmitted to the vehicle audio system by a dedicated signal circuit and a low reference circuit.

The audio system will mute and an audible ring will be heard though the speakers if the vehicle receives a call with the radio ON.

On some vehicles, the HVAC blower speed may be reduced when the OnStar® system is active to aid in reducing interior noise. When the system is no longer active, the blower speed will return to its previous setting.

OnStar® Sleep Cycle

The OnStar® system uses a unique sleep cycle to allow the system to receive cellular calls while the ignition is in the OFF position and retained accessory power mode has ended. This cycle enables the telematics communication interface control module to perform remote functions, such as door unlock, as commanded over the air by the OnStar® Call Center, and to continue to maintain an acceptable level of battery electrical drain.

The OnStar® system uses 4 states of readiness, depending upon the type of cellular market the vehicle is in when the ignition is put into the OFF state:

- High power
- Low power
- Sleep
- Digital standby

The high power state is in effect whenever the ignition is in the ON or RUN position, or retained accessory power is enabled, and the OnStar® system is sending or receiving calls or when the system is performing a remote function.

The low power state is in effect when the OnStar® system is idle with the ignition in the ON or RUN position, or with retained accessory power enabled.

The sleep state is entered after the vehicle has been shut off and the retained accessory power has timed out while in an analog cellular area. At a predetermined time recorded within the telematics communication interface control module, the system re-enters the low power state to listen for a call from the OnStar® Call Center for 1 minute. After this interval, the system will again return to the sleep state for 9 minutes. If a call is sent during the 1 minute interval, the OnStar® system will receive the call and immediately go into the high power mode to perform any requested functions. If no call is received during the 1 minute interval, the system will go back into the sleep mode for another 9 minutes. This process will continue for up to 48 hours, after which the OnStar® system will turn off until the ignition is turned to the ON or RUN position.

The digital standby power state is entered after the vehicle has been shut off and the retained accessory power has timed out while in a digital cellular area. When in digital standby mode, the OnStar® module is able to perform all remote functions as commanded by an OnStar® advisor at any time, for a continuous 120 hours. After 120 hours, the OnStar® module will go into sleep mode until a wake up signal from the vehicle is seen by the telematics communication interface control module. If the OnStar module loses the digital cellular signal it will revert to analog mode and follow the standard sleep state (9 minutes OFF, 1 minute standby) based on the time of the GPS signals, this will continue until a digital cellular signal is again received.

If the OnStar® system loses battery power while the system is in a standby or sleep mode, the system will remain OFF until battery power is restored and the ignition is turned to the ON or RUN position.

Features

OnStar® Personal Calling

The hands free, OnStar® personal calling cellular phone feature is an additional feature of the OnStar® system. This feature is embedded within the telematics communication interface control module; however it must be activated by an OnStar® advisor. OnStar® personal calling operates similar to most hand held cellular phones in that the availability for its usage is based on minutes or units. The customer must have a current OnStar® subscription, as this feature cannot be utilized without it. To use OnStar® personal calling, the customer must also purchase units (minutes) as outlined in the owners guide provided with the OnStar® system. Units begin to deplete, 1 unit is equal to 1 minute, as the customer makes outbound phone calls, answers inbound phone calls, or while connected to the OnStar® virtual advisor. In addition, units may also have an expiration date, depending upon the type of units purchased.

Customers have the ability to store telephone numbers within the module, referenced by a nametag for the convenience of frequently dialed numbers. After storing a nametag, the user can dial this number by initiating the OnStar® personal calling feature, speaking the word "call," and repeating the nametag assigned.

Turn by Turn Navigation

Turn by Turn Navigation allows the driver to contact OnStar® to obtain directions for driving from a current

location to a desired location. The Turn by Turn Navigation system stores your planned route and continually checks your position along that route, when you deviate from the planned route, the system will recognize this and prompt the driver with verbal prompts for how to proceed. The driver then responds verbally to direct the system to continue the current routing or to recalculate the route because of a missed turn.

Advisor Record Feature

The Advisor Record Feature allows the user to store any information given during a call with an OnStar® Advisor. Recording is activated by pressing the blue OnStar button during a call; pressing the button a second time stops the recording. The stored information can be played back by pressing the phone button on the three button assembly and using the voice command "Advisor Playback".

Deactivated OnStar® Accounts

In the event a customer has not renewed their OnStar® account after expiration or the account was never activated, OnStar® will make a discrete cellular call to the vehicle to deactivate the OnStar® system. Before taking this action, customers are notified that the OnStar® system in their vehicle will be deactivated unless they elect to renew the account. After the OnStar® account has been deactivated, customers will experience the following:

- The OnStar® status LED will not illuminate.
- The OnStar® system will NOT attempt to connect to the OnStar® Call Center in the event of a collision or if the vehicle's front air bags deploy for any other reason.
- An emergency button press will play a demo message indicating the service has been deactivated.
- An OnStar® Call Center button press will connect the customer with a dedicated sales team who can sell an OnStar® subscription and reactivate the vehicle. Depending on the type of OnStar® hardware in the vehicle, the customer may first hear a demonstration message stating there is no current OnStar® subscription for the vehicle, and directing the customer what to do to activate services.
- OnStar® personal calling will not be available, as this feature requires the customer to have a current OnStar® account. Attempts to use this feature may result in cellular connection failure messages and the inability to connect to the number dialed.

Certain vehicles that have never had an active OnStar® account, or that have been deactivated, may be unable to establish a connection with the OnStar® Call Center. When normal published diagnostic procedures do not indicate a possible cause for the no connect concern, the vehicle may have been deactivated. For deactivated vehicles, a no connect response should be considered normal operation. Further diagnosis and subsequent repair is only necessary should the customer elect to become an active OnStar® subscriber or renew the account subscription.

OnStar® Cellular, GPS, and Diagnostic Limitations

The proper operation of the OnStar® System is dependent on several elements outside the components integrated into the vehicle. These include the National Cellular Network Infrastructure, the cellular telephone carriers within the network, and the GPS.

The cellular operation of the OnStar® system may be inhibited by factors such as the users range from an analog or digital cellular tower, the state of the cellular carrier's equipment, and the location where the call is

placed. Making an OnStar® key press in areas that lack sufficient cellular coverage or have a temporary equipment failure will result in either the inability of a call to complete with a data transfer or the complete inability to connect to the OnStar® Call Center. The OnStar® system may also experience connection issues if the identification numbers for the module, station identification number, electronic serial number or manufacturers electronic ID, are not recognized by the cellular carriers local signal receiving towers.

The satellites that orbit earth providing the OnStar system with GPS data have almost no failures associated with them. In the event of a no GPS concern, the failure will likely lie with the inability of the system to gain GPS signals because of its location, i.e. in a parking structure, hardware failure, or being mistaken with an OnStar® call which has reached the Call Center without vehicle data.

During diagnostic testing of the OnStar® system, the technician should ensure the vehicle is located in an area that has a clear unobstructed view of the open sky, and preferably, an area where analog or digital cellular calls have been successfully placed. These areas can be found by successfully making an OnStar® keypress in a known good OnStar® equipped vehicle and confirming success with the OnStar® Call Center advisor. Such places can be used as a permanent reference for future OnStar® testing.

Mobile Identification Number and Mobile Directory Number

The telematics communication interface control module utilizes 2 numbers for cellular device identification, call routing and connection, a mobile identification number and a mobile directory number. The mobile identification number represents the number used by the cellular carrier for call routing purposes while the mobile directory number represents the number dialed to reach the cellular device.

Operation of the OnStar® Speech Recognition Systems

OnStar® users communicate with 2 speech recognition systems. Speech recognition allows the user to speak to one computer in the vehicle, and one reached over a phone line. The computer tries to understand the users command, and responds by speaking back, or by taking the appropriate action, e.g. dialing the phone.

- Personal Calling uses a speech recognition system that resides in the vehicle. When the user presses the phone button, the system states, Ready, and listens for the user's command. The user can speak commands to control the hands-free phone.
- Virtual advisor is a remote speech recognition system that the caller can access by making a phone call. The user connects to virtual advisor by requesting it during personal calling use. The user is then transferred to the virtual advisor server and talks to it via a cellular connection.

The OnStar® speech recognition systems use speech technology that is designed to understand a wide range of American English speakers. Although there is no one right way to speak English, the system will work best when users try to modify their pronunciation should they encounter difficulty. Users who do not obtain good results are advised to try the tips and workarounds found in this section.

General Tips for Better Speech Recognition

Concern	Tip for Better Result
Noise	Noise may confuse the speech recognition system. You usually get better performance from the system in quieter conditions:

	• The HVAC fan creates noise. Turn it down or OFF for better speech system performance. • Driving at high speeds creates louder engine noise and wind noise. You may get better results at lower speeds. • An open window or an open sunroof allows more noise to enter the vehicle. Close all windows for better results. • Noisy rainstorms can also reduce performance. • If passengers are talking while you use the speech system, it may be confused by their speech. You will get better results if all occupants of the vehicle are quiet while the system is listening for commands.
When to Speak	In Personal Calling, the system is only listening after it prompts you to speak with a beep. • When the system prompts you to speak, you have about 5 seconds to respond. If the system does not hear a response, it will prompt you again, or cancel the transaction. • If you begin to speak too soon, try pausing for a half second before speaking after the beep. • In the Virtual Advisor, the system is always listening for commands, even while it is speaking.
How to Speak	Speak forcefully, and clearly. • The noisier the environment, the louder you need to speak. If you are in the driver seat, speak facing the front of the car. If you are a passenger, speak facing the rearview mirror. • Speak calmly, and naturally. The system may sometimes fail your repeated attempts to give a command. If your speech is distorted by shouting or frustration, this may cause more errors. • People with high-pitched voices may have better results by speaking in a deeper, lower-pitched voice. However, do not lower the volume of the voice. • Avoid speaking with a rising intonation, like asking a question. Use a flat or falling intonation, like giving an answer.
What to Say	Personal Calling: One-word commands • The Personal Calling system listens for only one word at a time. There are some exceptions, 2-word phrases that are spoken and understood as a single word, e.g. "virtual advisor", "voice feedback", and "my number". You can enter phone numbers only one digit at a time, and the system repeats each digit as it hears it. • Say "Help" at the Ready prompt to hear the list of Personal Calling commands. • Virtual Advisor can understand sentences with more than one word. It also expects to hear a 4-digit number all at once when it asks for

	your PIN. • Say, "What are my choices?" to hear a list of commands that the Virtual Advisor understands.
Entering a phone number	• If you have trouble getting numbers correctly into the system, store your frequently-called number in the directory, so the system will remember them. After you have stored a number with a nametag, then you simply say "call" and the nametag in order to call the number. • If the system cannot understand your numbers, ask another person to help you enter your frequently-called numbers. This person can speak the numbers, then you can speak the nametag.
Storing or dialing a number	When you have finished speaking your phone number, you do not need to say "store" or "dial" to indicate that you are done. If you pause and say nothing, the system will ask you if you want to store or dial. Say "yes".
Creating nametags	• Short nametags that are similar may be easily confused by the system. You may get better recognition of your nametags if you make them longer, for example "George Washington" without pause, instead of "George" only. • If you want to use nametags while driving, it is best to store the nametag with some vehicle noise in the background. If you are in park while you are storing nametags, you can turn the fan on low or open windows in order to create some background noise.
Virtual Advisor 4-digit PIN	Say the 4 digits in a natural way, without pausing between digits.
Interrupting	• When the Virtual Advisor is speaking, you can interrupt it with another command. The first word in your command helps to get its attention. • If the Virtual Advisor has trouble understanding your commands when you interrupt, try speaking the first word loudly and clearly, then pause for an instant, then continue with the rest of the command. For example: "Get... my weather" or "Lookup... a quote for General Motors".

RADIO/AUDIO SYSTEM DESCRIPTION AND OPERATION

The entertainment system on this vehicle may have several different configurations available to it. To determine the specific configuration of the vehicle, please see the Service Parts ID Label, and refer to **RPO Code List** .

Each item in the list below represents topics covered in detail below.

- Radio Circuit Operation
- Antenna System
- Radio Reception
- Digital Radio Receiver (If equipped)
- Speaker Operation

- Theft Deterrent
- OnStar ®
- Auxiliary Audio Input Jack
- USB Port (if equipped)
- Bluetooth ® (If equipped)
- Applications (if equipped)
- Steering Wheel Controls (If equipped)
- Speed Controlled Volume (SCV) (If equipped)

Radio Circuit Operation

Radio Power

The radio does not use a discrete ignition feed circuit for power moding. The power mode master provides the system power mode to the radio via serial data messages. The power mode master determines the system power mode by processing power mode information from ignition switch inputs. Serial data power modes supported by the radio are OFF, ACCESSORY, RUN, and CRANK REQUEST.

Radio Grounds

The vehicle harness provides a ground for the radio circuits. The radio may also be case grounded.

Radio Data Link Communication

The radio communicates with other modules via serial data.

Radio Audio Outputs

Each of the audio output channel circuits (+) and (-), at the radio have a DC bias voltage that is approximately one half of battery voltage. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the

input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Remote Enable Output

The remote enable circuit is a discrete 12 V signal supplied to infotainment system components when the radio is producing audio, needs the front display on, needs video entertainment system components on, or needs to produce chimes. This signal is used to control the power state of the components. There is no output on radio the remote enable circuit when the vehicle is in the CRANK powermode, this is to minimize current consumption from the attached modules and also to avoid audio pops during crank events.

Antenna System

Multi-Band Antenna

The multi-band antenna is located on the roof of the vehicle. Keep this antenna clear of snow and ice build up for clear reception. If the vehicle has a sunroof, the performance of the system may be affected if the sunroof is open. Loading items onto the roof of the vehicle can interfere with the performance of the system, ensure the multi-band antenna is not obstructed.

The radio antenna is enabled when the radio is turned on. The radio provides battery voltage to the antenna using the center conductor of the antenna coaxial cable. This DC voltage does not affect the incoming radio signal. When a 12 V signal is seen by the antenna on the center conductor of the antenna coax, both AM and FM signals are amplified.

Radio Reception

AM/FM Radio Signal

The radio signal is sent from a broadcast station and is then received by an antenna. The strength of the signal received depends on the following:

- The power output (wattage) of the broadcasting station
- The location of the vehicle (or receiver) relative to the broadcast tower.
- Height of the broadcast antenna
- Height of the receiving antenna
- Obstacles between the tower and the receiver
- Atmospheric conditions
- What band (AM or FM) the station is broadcasting
- Type of antenna and the ground plane

Radio Data System (RDS)

The RDS feature is available only on FM stations that broadcast RDS information. This system relies upon receiving specific information from these stations and only works when the information is available. While the radio is tuned to an FM-RDS station, the station name or call letters display. RDS data is carried in what is

known as a "subcarrier". A subcarrier is a frequency that the FM broadcaster is authorized to use to send data that is not audible in the main audio program.

RDS functions will only work with FM broadcast stations that are broadcasting RDS data. Not all FM Broadcast stations broadcast RDS data or offer all of the RDS services.

The information displayed is dependent upon the information broadcast by the particular station. The information may vary greatly between stations. RDS functions may not work properly when reception is weak, reception is of poor quality, or RDS is not implemented properly by the FM Broadcaster. In some cases, a radio station broadcasting incorrect information may cause the RDS features of the radio to appear to work improperly.

With RDS, the radio can do the following:

- Display text information such as: station identification, type of programming, and general information (artist and song title, station messages, call in phone numbers, etc.).
- Seek to stations broadcasting the selected type of programming
- Receive announcements concerning local and national emergencies
- Receive alert warnings of local or national emergencies. When an alert announcement comes on the current radio station, ALERT! displays. You will hear the announcement, even if the volume is low or a CD is playing. If a CD is playing, play stops during the announcement. Alert announcements cannot be turned off. ALERT! is not affected by tests of the emergency broadcast system. This feature is not supported by all RDS stations.

Digital Radio Receiver (if equipped)

The XM satellite radio is integrated into the radio. XM satellite radio provides digital radio reception. The XM signal is broadcast from two satellites and, where necessary, terrestrial repeaters. The high power satellites allow the antenna to receive the XM signal even when foliage and other partial obstructions block the antennas view of the satellite. Terrestrial repeaters are used in dense urban areas. These repeaters will receive the satellite signal and re-broadcast them at much higher power levels in order to ensure reception in areas with densely packed tall buildings. A service fee is required in order to receive the XM service.

Speaker Operation

Speakers turn electrical energy into mechanical energy to move air, using a permanent magnet and an electromagnet. The electromagnet is energized when the radio or amplifier (if equipped) delivers current to the voice coil on the speaker. The voice coil will form a north and south pole that will cause the voice coil and the speaker cone to move in relation to the permanent magnet. The current delivered to the speaker is rapidly changing alternating current (A/C). This causes the speaker cone to move in two directions producing sound.

Theft Deterrent

The radio theft deterrent system is intended to disable or limit radio functionality if incorrect vehicle information is received by the radio. The radio disables functionality if the VIN information received by the radio does not match the VIN information that has been learned by the radio. The radio receives this information via serial data. A possible cause of incorrect VIN info could be the radio was originally installed in

another vehicle.

The radio has the following theft operating modes as part of the theft deterrent system:

- Normal Mode: The radio has learned a correct VIN sequence and the VIN information received via serial data matches the learned VIN sequence. In this mode the radio has full functionality.
- No VIN Mode: The radio has not received or learned a correct VIN sequence. In this mode the radio has limited functionality.
- Theft Detected Mode: The radio has learned a correct VIN sequence and the VIN information received via serial data does NOT match the learned VIN sequence. In this mode the radio may be disabled or have limited functionality. The radio display will indicate that theft protection is active.

OnStar ® (If equipped)

When OnStar is activated, a serial data message is sent to the radio that activates a software program. When the software begins its process, the fade goes to the front, Bass and Treble are set to the mid range, the outputs are mono, and the audio source is OnStar. OnStar takes priority over any other audio source. All of these actions are preset values stored in the radio.

For additional OnStar information, refer to **OnStar Description and Operation**.

Auxiliary Audio Input Jack

The infotainment system has a 3.5mm (1/8 in.) auxiliary audio input jack available on the face of the radio. This input interfaces internally with the radio, no external circuits are involved.

The infotainment system may also have an additional auxiliary audio input jack located in the instrument panel compartment. Audio signals from the device are sent to the radio from the auxiliary jack via the left, right, and common audio signal circuits.

When a portable audio playback device is connected to the auxiliary jack, an internal switch detects the connection and the radio will switch to AUX as the audio source.

- When a device is first connected to the 3.5mm (1/8 in.) input jack the infotainment system automatically switches to that device. If an auxiliary device has already been connected, press the AUX or CD/AUX button to select the device.
- Playback of an audio device that is connected to the 3.5mm jack can only be controlled using the controls on the device.
- The volume control on the device may need to be adjusted to ensure sufficient playback volume through the infotainment system.

USB Port (if equipped)

The infotainment system may have a USB connector located in the instrument panel compartment. The USB connector interfaces directly with the radio. The USB connector supports both USB standards 1.1 and 2.0.

USB supported devices:

- USB Flash Sticks (Thumb Drives)
- Portable USB Hard Drives
- Portable Digital Media Players (iPOD®, ZUNE®, etc.)

Depending on the USB device, some devices may not be recognized, or some features/functions may not be able to be controlled with the radio controls. USB HUB devices are not supported.

Bluetooth ® (If Equipped)

Bluetooth ® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. The operating range of the signal is approximately 30 feet.

The available features and functions are determined by the type of device and the software within the devices being used. For a feature or function to operate, it must be supported in both devices.

The first connection between devices is established through a process called pairing. In order to pair two devices, a password (passkey) has to be exchanged between the two devices. One device will generate the password, the other device accepts the password to complete the process. Once the devices are paired, future connections between the devices will occur automatically when the devices are on and within range of each other.

The Bluetooth ® hardware is internal to the radio. The radio supports streaming of data (music, voice, information) from cellular phones and other mobile devices that support those features. The radio may also be capable of interfacing with cellular phones for hands-free features.

- The device must be paired to the radio to use the available Bluetooth ® feature(s). The pairing process must only be performed once for each device, unless that device's information is deleted.
- Up to five devices can be paired to the system, but only one can be connected at any given time.
- Streaming Audio allows playing music from the mobile device wirelessly. Music stored on the mobile device can be viewed and controlled from the display.
- To stream audio from a mobile device, the device must be unlocked, and any additional applications should be closed.

Refer to the vehicle owners manual, supplements, and the device manufacturers information for pairing instructions.

Applications (If equipped)

When the system is equipped with Bluetooth ®, the system may be capable of using applications, commonly referred to as apps.

The term application refers to any piece of software that works on a system (hardware) that is being operated by it's own software. Applications are typically small software programs which uses the hardware to perform a specific task, as opposed to operating the entire system.

- For an application to be used, it must be installed on both the vehicle infotainment system and a compatible mobile device.
- The device must be connected to the system. this may be done wirelessly via Bluetooth ®, or via the vehicle USB port. Refer to the device manufacturers information for the proper connection method.
- When the device is connected, the application on the radio is used to remotely access and control the application on the mobile device.
- The application must work correctly on the device to work with the vehicle infotainment system.
- The user may be required to log-in to the application on the mobile device before using the application from the vehicle controls.
- Using applications will use the device's data plan.
- The device must be unlocked, and any additional applications should be closed.

Refer to the owner's manual and supplements for information on mobile devices, control, and operation.

Steering Wheel Controls (If equipped)

Some audio functions are available using the steering wheel controls. The steering wheel controls duplicate the function of the primary controls available on the radio.

For additional information on steering wheel controls, refer to **Steering Wheel Controls Description and Operation** .

Speed Compensated Volume (If equipped)

With Speed Controlled Volume (SCV), the audio system will adjust automatically to make up for road and wind noise as you drive, by increasing the volume as vehicle speed increases. To use SCV, set the volume at the desired level, and then select either Low, Medium, or High. To turn SCV off, select the Off screen button.

SPECIAL TOOLS (MIT TOOL INSTRUCTIONS)

Bluetooth Pairing for Vehicles with Radio RPO: UF7

Either reset the pin code on the radio to 0000, or go under Device Info on the radio and see what the pin code is (to enter it later on the MIT).

1. Turn the BT discoverable ON in the radio Bluetooth settings.
2. Press Pair Device on radio (DO NOT PRESS SEARCH BLUETOOTH DEVICES ON THE RADIO).
3. Press the Pair button on the MIT.
4. When the three LED lights begin flashing on the MIT, enter the pin code (either 0000 if you reset it to that or what the radio pin code was).

5. MIT will then automatically connect with the radio and should show "MIT Connected" message.

Make test call and the audio streaming test.

Holden Radio Bluetooth Pairing Instructions

1. Using the radio controls, place the radio into "Discoverable Mode".
2. Place the MIT into Bluetooth mode by pressing TEST SELECTOR until the Bluetooth LED is illuminated.
3. With the MIT in Bluetooth mode Press and Release the #1 button (the Bluetooth LED will begin to slowly blink).
4. Now Press and release the PAIR/CALL button on the MIT (the Bluetooth LED will begin to blink a little faster).
5. On the radio Enter the PASSKEY when prompted: (press "0000" then Press "OK").
6. The MIT and radio will PAIR and CONNECT (the Bluetooth LED will be Fast Flashing).
7. Use as regular MIT at this point.

For all other Radios

Testing the Bluetooth Function

1. Verify connection of the MIT to the USB port.
2. Press and release the TEST SELECTOR button until the Bluetooth LED illuminates.
3. Disable all other Bluetooth devices present in the vehicle (ie. cell phones, laptops, etc.).

Standard Bluetooth Pairing/Bonding

1. Use the vehicle controls to place the radio into Bluetooth Pairing mode. The vehicle will prompt you with a security code.
2. Press and release the PAIR/CALL button. The Bluetooth LED will blink slowly while preparing to have a security code entered.
3. Wait for the all three LEDs to blink confirming it is ready to have the security code entered.
4. Enter the code with the MIT keypad and hit ENTER.
5. The Bluetooth LED will blink slowly while pairing/bonding and move to a quick flash once paired/bonded.

The vehicle should confirm pairing/bonding is complete.

Streaming Audio

1. Confirm pairing/bonding is complete - the Bluetooth LED will be in a quick flash mode.
2. On some radios the MIT automatically begins streaming audio via A2DP. The audio playback will confirm that the Bluetooth connection using streaming and the audio is working correctly.
3. On other radios you will need to select Bluetooth Audio from the Source menu to verify Audio

Streaming.

4. Audio playback confirms that the Bluetooth connection using Streaming Audio is working correctly.
5. Placing a test call will temporarily stop the streaming audio function, but upon disconnection of that test call,

the streaming audio from the MIT will resume.

To Place a Test Call

1. Confirm pairing/bonding is complete - the Bluetooth LED will be in a quick flash mode. If the vehicle is equipped with streaming audio, and the radio is set to play a Bluetooth audio file, the streaming audio playback will be audible.
2. Press and release PAIR/CALL button to place a test call. Streaming audio will be temporarily turned off.
3. Use the vehicle controls to answer the call.

NOTE: If the call is not answered within several rings, the MIT's audio files will not transmit, even though an active call is occurring.

4. Audio playback confirms that the Bluetooth connectivity is working correctly.

NOTE: The MIT will remain paired/bonded when the call is ended by the vehicle. To re-test the call function, place the MIT in Bluetooth mode and press and release the Pair button to reconnect. When testing is completed, delete MIT from the audio system before returning the vehicle to the customer.

5. Use the vehicle controls to end the call. If applicable, streaming audio will resume.

Testing the AUX/Line-In Function

1. Verify connection of the MIT as stated above.
2. Press and release the TEST SELECTOR button until the MIT AUX LED illuminates.
3. Use the vehicle controls to put the audio system into Audio (Line-In) mode.
4. Audio playback confirms that the audio input is working correctly.

Testing the USB Function

1. Verify connection of the MIT as stated above.
2. Press and release the TEST SELECTOR button until the MIT USB LED illuminates.
3. Use the vehicle controls to put the audio system into USB mode.

NOTE: Volume levels may vary dependent upon vehicle audio system.

4. Audio playback confirms that the USB is working correctly.

Troubleshooting Guide

If the MIT unit is still not working properly after following the below troubleshooting, the unit is malfunctioning and should be repaired or replaced.

Unit not Working

- Verify the MIT is powered on correctly as indicated by the green Power LED.
- If Power LED is not illuminated, verify USB power source is working properly.
- If USB power adapter is being used to power the MIT, check and, if necessary, replace the fuse in adapter.

Problem with Aux/Line-In Test

- Verify Aux/Line- In test cable is inserted properly into the vehicle audio input jack. Verify the MIT is in Aux/Line-In mode as indicated by the red AUX LED.
- Verify the vehicle audio system is in Auxiliary or Line-in mode. Verify the vehicle audio system volume is turned up and not in mute mode.

Problem with USB Test

- Verify MIT is in USB mode as indicated by the red USB LED. Verify the vehicle audio system is in USB mode.
- Verify the vehicle audio system volume is turned up and not in mute mode.

Problem with Bluetooth Pairing

- Delete previous devices stored in the device list of the radio and the pair the MIT
- Remove USB cable, and then reconnect to reset the MIT. Carefully follow the bonding instructions for the correct Passkey procedure.

Problem with Bluetooth Test Call Audio

- Verify the MIT is paired with the vehicle. This is indicated by the quick flashing Bluetooth LED.
- Audio system should have indicated the MIT is bonded.

SPECIFICATIONS

DIMENSIONS - BODY

Point-to-point measurements are for reference only. All measurements are given in millimeters. Use these measurements for diagnosing and estimating. Point-to-point measurements are duplicated with tram bar pointers set at equal lengths. All die marks, holes, slots and fasteners are measured to the center. All dimensions are symmetrical unless otherwise specified

REPAIR INSTRUCTIONS

OVERLAP/BACKING PLATE SECTIONING

WARNING: Refer to Approved Equipment for Collision Repair Warning .

1. Fit the service panel to the vehicle to ensure a proper fit.
2. Measure and mark a line at the sail panel 120 mm (4 3/4 in) from the back glass opening and 70 mm (2 3/4 in) rearward from the rocker panel locating hole edge of the service panel.
3. Cut along the line to trim the service panel.
4. Fabricate a 50 mm (2 in) backer plate so that the panel will fit behind the sectioning joint at the sail panel.
5. Fabricate a 100 mm (4 in) backer plate for the rocker panel.
6. Drill 8 mm (5/16 in) plug weld holes as necessary in the locations noted from the original panel.
7. Bevel the sail panel and service panel edges at the sectioned area to approximately 10 degrees.
8. Grind a 50 mm (2 in) area of the outer surface on the vehicle to remove any corrosion, E-coat, primers, coatings and galvanizing that may be present.
9. At the section area on the service panel, grind a 50 mm (2 in) area of the back side to remove any corrosion, E-coat, primers, coatings and galvanizing that may be present.
10. Drill plug weld holes approximately 13 mm (1/2 in) from the edge of the cuts the sectioning areas of the service panel and the original panel.
11. Prepare all mating surfaces as necessary.
12. Apply GM-approved weld-thru coating or equivalent to all mating surfaces. Refer to Anti-Corrosion Treatment and Repair .
13. Position and clamp or screw the backer plate with half of the backer plate exposed at the sectioning joint.

NOTE: Leave a gap of 1 1/2 times the thickness of the metal at the sectioning joint to the original panel.

14. Position the service panel to overlap the backer plate and 1 1/2 times the thickness up to the original panel.
15. Check for proper fit and alignment to the vehicle. Clamp the panels together.
16. Plug weld the backer plate accordingly.
17. Stitch weld along the entire sectioning joint, make 25 mm (1 in) welds along the seam with 25 mm (1 in) gaps between them.
18. Complete the stitch weld.
19. Clean and prepare all welded surfaces of the entire sectioning joint.

NOTE: Always follow the system manufacturer's instructions for application, handling and curing.

20. Apply a lightweight body filler to the backer plate area.

DRIVETRAIN AND FRONT SUSPENSION FRAME FRONT SUPPORT REPLACEMENT

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning

WARNING: Refer to Collision Sectioning Warning

WARNING: Refer to Glass and Sheet Metal Handling Warning

1. Disable the SIR System. Refer to SIR Disabling and Enabling
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair

Fig. 10: Drivetrain And Front Suspension Frame
Courtesy of GENERAL MOTORS COMPANY

6. Create cut lines on the drivetrain and front suspension frame front support.

Fig. 11: Inner Panels

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage any inner panels or reinforcements.

7. Cut the panel where sectioning is to be performed.

Fig. 12: Drilling all factory welds

Courtesy of GENERAL MOTORS COMPANY

8. Locate and mark all the necessary factory welds of the drivetrain and front suspension frame front support.
9. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 13: Drivetrain And Front Suspension Frame
Courtesy of GENERAL MOTORS COMPANY

10. Remove the damaged drivetrain and front suspension frame front support.

Installation Procedure

Fig. 14: Cutting Drivetrain And Front Suspension Frame Front Support
Courtesy of GENERAL MOTORS COMPANY

1. Cut the drivetrain and front suspension frame front support in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one-and-one-half-times the metal thickness at the sectioning joint.
2. Create a 50 mm (2 in) backing plate from the unused portion of the service part.
3. Drill 8 mm (5/16 in) along the sectioning cut on the remaining original part. Locate these holes 13 mm (1/2 in) from the edge of part and spaced 40 mm (1 1/2 in) apart.
4. Prepare all mating surfaces as necessary.
5. Fit the backing plates halfway into the sectioning joints, clamp in place and plug weld to the vehicle.
6. Align the drivetrain and front suspension frame front support.

Fig. 15: Drilling For Plug Welding Along Edges Of Front Suspension Frame Front Support
Courtesy of GENERAL MOTORS COMPANY

7. Drill 8 mm (5/16 in) for plug welding along the edges of the front suspension frame front support as noted from the original panel.
8. Clean and prepare the attaching surfaces for welding.
9. Position the front suspension frame front support on the vehicle.
10. Verify the fit of the front suspension frame front support.
11. Clamp the front suspension frame front support into position.

Fig. 16: Suspension Frame Front Support
Courtesy of GENERAL MOTORS COMPANY

12. Plug weld accordingly.
13. To create a solid weld with minimum heat distortion, make 25 mm (1 in) stitch welds along the seam with 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
14. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
15. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
16. Install all related panels and components.
17. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
18. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

FRONT COMPARTMENT SIDE RAIL BRACKET REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

NOTE: In the Removal Procedure, steps 6, 7 and 8 are exactly the same except with different graphics.

1. Disable the SIR System. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all the related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .

Fig. 17: Locating Necessary Factory Welds
Courtesy of GENERAL MOTORS COMPANY

6. Locate and mark all the necessary factory welds and weld seams of the front compartment side rail.

Fig. 18: Locating Necessary Factory Welds
Courtesy of GENERAL MOTORS COMPANY

7. Locate and mark all the necessary factory welds and weld seams of the front compartment side rail.

Fig. 19: Locating Necessary Factory Welds
Courtesy of GENERAL MOTORS COMPANY

8. Locate and mark all the necessary factory welds and weld seams of the front compartment side rail.

Fig. 20: Front Compartment Side Rail Wheelhouse Panel
Courtesy of GENERAL MOTORS COMPANY

9. Remove the front compartment side rail wheelhouse panel.

Installation Procedure

Fig. 21: Drilling 8 mm (5/16 In) For Plug Welding Along Edges Of Front Compartment Side Rail
Courtesy of GENERAL MOTORS COMPANY

1. Drill 8 mm (5/16 in) for plug welding along the edges of the front compartment side rail as noted from the original panel.
2. Clean and prepare the attaching surfaces for welding.

Fig. 22: Front Compartment Side Rail Wheelhouse Panel
Courtesy of GENERAL MOTORS COMPANY

3. Position the front compartment side rail on the vehicle.
4. Verify the fit of the front compartment side rail on the vehicle.
5. Clamp the front compartment side rail into position.

Fig. 23: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

6. Plug the weld accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
8. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
9. Install all the related panels and components.
10. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
11. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

FRONT WHEELHOUSE PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to **Glass and Sheet Metal Handling Warning** .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .

Fig. 24: Removing Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

6. Locate and mark all the necessary factory welds and weld seams of the front wheelhouse panel.

Fig. 25: Drilling All Factory Welds
Courtesy of GENERAL MOTORS COMPANY

7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.
8. Cut the adhesive in the front area and where the front wheelhouse and the front compartment side rail overlap with an appropriate tool.

Fig. 26: Front Wheelhouse Panel
Courtesy of GENERAL MOTORS COMPANY

9. Remove the front wheelhouse panel.

Installation Procedure

Fig. 27: Drilling 8 Mm (5/16 In) For Plug Welding Along Edges Of Wheelhouse Panel
Courtesy of GENERAL MOTORS COMPANY

NOTE: Double the number of drills at the flange where the front wheelhouse panel and front compartment side rail overlap.

1. Drill 8 mm (5/16 in) for plug welding along the edges of the wheelhouse panel as noted from the original panel.
2. Clean and prepare the attaching surfaces for welding.

Fig. 28: Front Wheelhouse Panel

Courtesy of GENERAL MOTORS COMPANY

3. Position the wheelhouse panel on the vehicle.
4. Verify the fit of the wheelhouse panel on the vehicle.
5. Clamp the wheelhouse panel into position.

Fig. 29: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

6. Plug weld accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
8. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
9. Install all related panels and components.
10. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
11. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

FRONT COMPARTMENT UPPER SIDE RAIL REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to **Glass and Sheet Metal Handling Warning** .

1. Disable the SIR System. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .

Fig. 30: Marking All Necessary Factory Welds
Courtesy of GENERAL MOTORS COMPANY

6. Locate and mark all the necessary factory welds and weld seams of the front compartment upper side rail.
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

9. Remove the front compartment upper side rail.

Installation Procedure

Fig. 33: Drilling 8 Mm (5/16 In) For Plug Welding Along Edges Of Front Compartment Upper Side Rail

Courtesy of GENERAL MOTORS COMPANY

1. Drill 8 mm (5/16 in) for plug welding along the edges of the front compartment upper side rail as noted from the original panel.
2. Clean and prepare the attaching surfaces for welding.
3. Position the front compartment upper side rail on the vehicle.
4. Verify the fit of the front compartment upper side rail.
5. Clamp the front compartment upper side rail into position.

Fig. 34: Front Hinge Pillar Body Area
Courtesy of GENERAL MOTORS COMPANY

NOTE: Plug weld factory slots in the front hinge pillar body area (1) as noted from the original panel.

6. Plug weld accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .
8. Paint the repaired area. Refer to Basecoat/Clearcoat Paint Systems .
9. Install all related panels and components.
10. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
11. Enable the SIR system. Refer to SIR Disabling and Enabling .

FRONT HINGE PILLAR BODY SECTIONING

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

WARNING: Refer to Collision Sectioning Warning .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all the related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .

Fig. 35: Front Hinge Pillar Body
Courtesy of GENERAL MOTORS COMPANY

6. Create cut lines on the front hinge pillar body.

Fig. 36: Cutting Inner Panels

8. Locate and mark all the necessary factory welds of the front hinge pillar body.
9. Drill all the factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 38: Removing Damaged Front Hinge Pillar Body
Courtesy of GENERAL MOTORS COMPANY

10. Remove the damaged front hinge pillar body.

Installation Procedure

Fig. 39: Cutting Front Hinge Pillar Body In Corresponding Locations
Courtesy of GENERAL MOTORS COMPANY

1. Cut the front hinge pillar body in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one-and-one-half-times the metal thickness at the sectioning joint.
2. Create a 50 mm (2 in) backing plate from the unused portion of the service part.
3. Drill 8 mm (5/16 in) along the sectioning cut on the remaining original part. Locate these holes 13 mm (1/2 in) from the edge of part and spaced 40 mm (1 1/2 in) apart.
4. Prepare all mating surfaces as necessary.
5. Fit the backing plates halfway into the sectioning joints, clamp in place and plug weld to the vehicle.
6. Align the front hinge pillar body.

Fig. 40: Drilling for plug welding along edges of front hinge pillar body
Courtesy of GENERAL MOTORS COMPANY

7. Drill 8 mm (5/16 in) for plug welding along the edges of the front hinge pillar body as noted from the original panel.
8. Clean and prepare the attaching surfaces for welding.
9. Position the front hinge pillar body on the vehicle.
10. Verify the fit of the front hinge pillar body.
11. Clamp the front hinge pillar body into position.

Fig. 41: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

12. Plug the weld accordingly.
13. To create a solid weld with minimum heat distortion, make 25 mm (1 in) stitch welds along the seam with 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
14. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
15. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
16. Install all the related panels and components.
17. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
18. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

BODY HINGE PILLAR LOWER REINFORCEMENT REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to Collision Sectioning Warning .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .

Fig. 42: Marking Factory Welds
Courtesy of GENERAL MOTORS COMPANY

6. Locate and mark all the necessary factory welds and weld seams of the front hinge pillar body.
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 43: Front Hinge Pillar Body Reinforcement
Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged front hinge pillar body reinforcement.

Installation Procedure

1. Prepare all mating surfaces as necessary.
2. Align the front hinge pillar body reinforcement.

Fig. 44: Drilling 8 Mm (5/16 In) For Plug Welding Along Edges Of Front Hinge Pillar Body
Courtesy of GENERAL MOTORS COMPANY

3. Drill 8 mm (5/16 in) for plug welding along the edges of the front hinge pillar body as noted from the original panel.
4. Clean and prepare the attaching surfaces for welding.
5. Position the front hinge pillar body reinforcement on the vehicle.
6. Verify the fit of the front hinge pillar body reinforcement.
7. Clamp the front hinge pillar body reinforcement into position.

Fig. 45: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

8. Plug weld accordingly.
9. To create a solid weld with minimum heat distortion, make 25 mm (1 in) stitch welds along the seam with 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
10. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
11. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
12. Install all related panels and components.
13. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
14. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

ROOF OUTER PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .
6. Locate and mark all factory welds.

Fig. 46: Drilling All Factory Welds
Courtesy of GENERAL MOTORS COMPANY

7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.
8. Cut the adhesive with an appropriate tool.

Fig. 47: Damaged Roof Panel

9. Remove the damaged roof panel (1).

Installation Procedure

Fig. 48: Drilling 8 mm (5/16 In) For Plug Welding Along Edges Of Service Panel
Courtesy of GENERAL MOTORS COMPANY

1. Drill 8 mm (5/16 in) for plug welding along the edges of the service panel as noted from the original panel.
2. Clean and prepare the attaching surfaces for welding.

Fig. 49: Applying One-Part Windshield Urethane Adhesive
Courtesy of GENERAL MOTORS COMPANY

3. Apply one-part windshield urethane adhesive as noted from the original panel.
4. Position the roof panel on the vehicle.
5. Verify the fit of the panel.
6. Clamp the panel into position.

Fig. 50: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

7. Plug weld accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
9. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
10. Install all related panels and components.
11. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
12. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

ROOF FRONT HEADER PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to **Glass and Sheet Metal Handling Warning** .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
6. Locate and mark all factory welds.

Fig. 51: Drilling All Factory Welds
Courtesy of GENERAL MOTORS COMPANY

7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

6. Plug the weld accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
8. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
9. Install all related panels and components.
10. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
11. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

BODY LOCK PILLAR OUTER PANEL SECTIONING

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning**

WARNING: Refer to **Collision Sectioning Warning**

WARNING: Refer to Glass and Sheet Metal Handling Warning

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .

Fig. 63: Cut Lines On Body Lock Pillar Outer Panel
Courtesy of GENERAL MOTORS COMPANY

6. Create cut lines on the body lock pillar outer panel.

Fig. 64: Cutting Panel
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage any inner panels or reinforcements.

7. Cut the panel where sectioning is to be performed.

Fig. 65: Marking Necessary Factory Welds
Courtesy of GENERAL MOTORS COMPANY

8. Locate and mark all the necessary factory welds of the body lock pillar outer panel.
9. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 66: Body Lock Pillar Outer Panel
Courtesy of GENERAL MOTORS COMPANY

10. Remove the damaged body lock pillar outer panel.

Installation Procedure

Fig. 67: Cutting Body Lock Pillar Outer Panel
Courtesy of GENERAL MOTORS COMPANY

1. Cut the body lock pillar outer panel in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one-and-one-half-times the metal thickness at the sectioning joint.
2. Create a 50 mm (2 in) backing plate from the unused portion of the service part.
3. Drill a 8 mm (5/16 in) along the sectioning cut on the remaining original part. Locate these holes 13 mm (1/2 in) from the edge of part and spaced 40 mm (1 1/2 in) apart.
4. Prepare all mating surfaces as necessary.
5. Fit the backing plates halfway into the sectioning joints, clamp in place and plug weld to the vehicle.
6. Align the body lock pillar outer panel.

Fig. 68: Drilling 8 Mm (5/16 In) For Plug Welding Along Edges Of Body Lock Pillar Outer Panel
Courtesy of GENERAL MOTORS COMPANY

7. Drill a 8 mm (5/16 in) for plug welding along the edges of the body lock pillar outer panel as noted from the original panel.
8. Clean and prepare the attaching surfaces for welding.
9. Position the body lock pillar outer panel on the vehicle.
10. Verify the fit of the body lock pillar outer panel.
11. Clamp the body lock pillar outer panel into position.

Fig. 69: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

12. Plug the weld accordingly.
13. To create a solid weld with minimum heat distortion, make a 25 mm (1 in) stitch welds along the seam with 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
14. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
15. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
16. Install all related panels and components.
17. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
18. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

BODY LOCK PILLAR OUTER PANEL REINFORCEMENT REPLACEMENT

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .

Fig. 70: Drilling All Factory Welds
Courtesy of GENERAL MOTORS COMPANY

6. Locate and mark all the necessary factory welds of the body lock pillar outer panel reinforcement.
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 71: Removing Damaged Body Lock Pillar Outer Panel Reinforcement
Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged body lock pillar outer panel reinforcement.

Installation Procedure

1. Prepare all mating surfaces as necessary.
2. Align the body lock pillar outer panel reinforcement.

Fig. 72: Drilling 8 mm (5/16 in) For Plug Welding Along Edges Of Body Lock Pillar Outer Panel Reinforcement

Courtesy of GENERAL MOTORS COMPANY

3. Drill a 8 mm (5/16 in) for plug welding along the edges of the body lock pillar outer panel reinforcement as noted from the original panel.
4. Clean and prepare the attaching surfaces for welding.
5. Position the body lock pillar outer panel reinforcement on the vehicle.
6. Verify the fit of the body lock pillar outer panel reinforcement.
7. Clamp the body lock pillar outer panel reinforcement into position.

Fig. 73: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

8. Plug the weld accordingly.
9. To create a solid weld with minimum heat distortion, make a 25 mm (1 in) stitch welds along the seam with a 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
10. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
11. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
12. Install all related panels and components.
13. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
14. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

BODY LOCK PILLAR INNER PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .
6. Locate and mark all factory welds.

17. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
18. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

BODY SIDE OUTER PANEL REINFORCEMENT REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .

Fig. 87: Drilling All Factory Welds
Courtesy of GENERAL MOTORS COMPANY

6. Locate and mark all the necessary factory welds of the body side outer panel reinforcement.
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 88: Removing Damaged Body Side Outer Panel Reinforcement
Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged body side outer panel reinforcement.

Installation Procedure

1. Align the body side outer panel reinforcement.

Fig. 89: Drilling 8 Mm (5/16 In) For Plug Welding Along Edges Of Body Side Outer Panel Reinforcement

Courtesy of GENERAL MOTORS COMPANY

2. Drill a 8 mm (5/16 in) for plug welding along the edges of the body side outer panel reinforcement as noted from the original panel.
3. Clean and prepare the attaching surfaces for welding.

Fig. 90: Removing Damaged Body Side Outer Panel Reinforcement
Courtesy of GENERAL MOTORS COMPANY

4. Position the body side outer panel reinforcement on the vehicle.
5. Verify the fit of the body side outer panel reinforcement.
6. Clamp the body side outer panel reinforcement into position.

Fig. 91: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

7. Plug the weld accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
9. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
10. Install all related panels and components.
11. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
12. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

REAR COMPARTMENT FLOOR PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to **Glass and Sheet Metal Handling Warning** .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .

Fig. 92: Drilling All Factory Welds
Courtesy of GENERAL MOTORS COMPANY

6. Locate and mark all the necessary factory welds of the rear compartment floor panel.
7. Note the number and location of weld studs for installation of the service assembly.
8. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 93: Removing Damaged Rear Compartment Floor Panel
Courtesy of GENERAL MOTORS COMPANY

9. Remove the damaged rear compartment floor panel.

Installation Procedure

1. Align the rear compartment floor panel.

Fig. 94: Drilling 8 Mm (5/16 In) For Plug Welding Along Edges Of Rear Compartment Floor Panel
Courtesy of GENERAL MOTORS COMPANY

2. Drill a 8 mm (5/16 in) for plug welding along the edges of the rear compartment floor panel as noted from the original panel.
3. Clean and prepare the attaching surfaces for welding.
4. Position the rear compartment floor panel on the vehicle.
5. Verify the fit of the rear compartment floor panel.
6. Clamp the rear compartment floor panel into position.

Fig. 95: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

7. Plug the weld accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
9. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
10. Install all related panels and components.
11. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
12. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

QUARTER OUTER PANEL SECTIONING

Special Tools

- **BO-6392** Flanging Tool Kit
- **BO-6396** Bonding Pliers

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

WARNING: Refer to Approved Equipment for Collision Repair Warning .

WARNING: Refer to Collision Sectioning Warning .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .

9. Locate and mark all the necessary factory welds of the quarter outer panel.
10. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 100: Removing Damaged Quarter Outer Panel
Courtesy of GENERAL MOTORS COMPANY

11. Remove the damaged quarter outer panel.

Installation Procedure

Fig. 101: Cutting Quarter Outer Panel
Courtesy of GENERAL MOTORS COMPANY

1. Cut the quarter outer panel in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one-and-one-half-times the metal thickness at the sectioning joint.
2. Create a 50 mm (2 in) backing plate from the unused portion of the service part.
3. Drill a 8 mm (5/16 in) along the sectioning cut on the remaining original part. Locate these holes 13 mm (1/2 in) from the edge of part and spaced 40 mm (1 1/2 in) apart.
4. Prepare all mating surfaces as necessary.
5. Fit the backing plates halfway into the sectioning joints, clamp in place and plug weld to the vehicle.
6. Align the quarter outer panel.

Fig. 102: Drilling 8 mm (5/16 in) For Plug Welding Along Edges Of Quarter Outer Panel
Courtesy of GENERAL MOTORS COMPANY

7. Drill a 8 mm (5/16 in) for plug welding along the edges of the quarter outer panel as noted from the original panel.
8. Clean and prepare the attaching surfaces for welding.

Fig. 103: Applying Structural Adhesive
Courtesy of GENERAL MOTORS COMPANY

9. Apply structural adhesive (1) as noted from the original panel.
10. Position the quarter outer panel on the vehicle.
11. Verify the fit of the quarter outer panel.
12. Clamp the quarter outer panel into position.

Fig. 104: Identifying BO-6396 Pliers And BO-6392 Tool Kit
Courtesy of GENERAL MOTORS COMPANY

13. Plug the weld accordingly.
14. To create a solid weld with minimum heat distortion, make 25 mm (1 in) stitch welds along the seam with 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
15. Pre-flang the flange with **BO-6396** pliers and **BO-6392** tool kit.

Fig. 105: Closing Wheelhouse Flanging
Courtesy of GENERAL MOTORS COMPANY

16. Finish closing the wheelhouse flanging.
17. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
18. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
19. Install all related panels and components.
20. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
21. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

QUARTER INNER PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to **Glass and Sheet Metal Handling Warning** .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .

Fig. 106: Drilling Factory Welds

6. Locate and mark all factory welds.
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 107: Removing Damaged Quarter Inner Panel
Courtesy of GENERAL MOTORS COMPANY

8. Remove the damaged quarter inner panel.

Installation Procedure

1. Align the quarter inner panel.

Fig. 108: Drilling 8 Mm (5/16 In) For Plug Welding Along Edges Of Service Panel
Courtesy of GENERAL MOTORS COMPANY

2. Drill a 8 mm (5/16 in) for plug welding along the edges of the service panel as noted from the original panel.
3. Clean and prepare the attaching surfaces for welding.

Fig. 109: Removing Damaged Quarter Inner Panel
Courtesy of GENERAL MOTORS COMPANY

4. Position the quarter inner panel.
5. Verify the fit of the panel.
6. Clamp the panel into position.

Fig. 110: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

7. Plug weld accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
9. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
10. Install all related panels and components.
11. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
12. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

REAR RAIL SECTIONING

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to **Glass and Sheet Metal Handling Warning** .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .

Fig. 111: Creating Cut Lines On Rear Side Rail
Courtesy of GENERAL MOTORS COMPANY

6. Create cut lines on the rear side rail.

Fig. 112: Cutting Panel

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage any other panels or reinforcements.

7. Cut the panel where sectioning is to be performed.

Fig. 113: Drilling Factory Welds

Courtesy of GENERAL MOTORS COMPANY

8. Locate and mark all the necessary factory welds of the rear side rail.
9. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Fig. 114: Damaged Rear Side Rail
Courtesy of GENERAL MOTORS COMPANY

10. Remove the damaged rear side rail.

Installation Procedure

Fig. 115: Cutting Rear Side Rail In Corresponding Locations
Courtesy of GENERAL MOTORS COMPANY

1. Cut the rear side rail in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one-and-one-half-times the metal thickness at the sectioning joint.
2. Create a 50 mm (2 in) backing plate from the unused portion of the service part.
3. Drill 8 mm (5/16 in) along the sectioning cut on the remaining original part. Locate these holes 13 mm (1/2 in) from the edge of part and spaced 40 mm (1 1/2 in) apart.
4. Prepare all mating surfaces as necessary.
5. Fit the backing plates halfway into the sectioning joints, clamp in place and plug weld to the vehicle.
6. Align the rear side rail.

Fig. 116: Drilling 8 mm (5/16 in) For Plug Welding Along Edges Of Rear Side Rail
Courtesy of GENERAL MOTORS COMPANY

7. Drill 8 mm (5/16 in) for plug welding along the edges of the rear side rail as noted from the original panel.
8. Clean and prepare the attaching surfaces for welding.

Fig. 117: Damaged Rear Side Rail
Courtesy of GENERAL MOTORS COMPANY

9. Position the rear side rail on the vehicle.
10. Verify the fit of the rear side rail.
11. Clamp the rear side rail into position.

Fig. 118: Applying Sealers And Anti-Corrosion Materials
Courtesy of GENERAL MOTORS COMPANY

12. Plug the weld accordingly.
13. To create a solid weld with minimum heat distortion, make a 25 mm (1 in) stitch weld along the seam with 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
14. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
15. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
16. Install all related panels and components.
17. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
18. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

REAR END PANEL REPLACEMENT

Removal Procedure

WARNING: Refer to **Approved Equipment for Collision Repair Warning** .

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Disable the SIR system. Refer to SIR Disabling and Enabling .
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to Anti-Corrosion Treatment and Repair .

Fig. 119: Drilling Factory Welds
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note the number and location of welds for installation of the service assembly.

6. Locate and mark all the necessary factory welds of the body rear end panel.
7. Drill all factory welds.

Fig. 120: Body Rear End Panel
Courtesy of GENERAL MOTORS COMPANY

8. Remove the body rear end panel.

Installation Procedure

Fig. 121: Drilling 8 mm (5/16 in) For Plug Welding Along Edges Of Body Rear End Panel
Courtesy of GENERAL MOTORS COMPANY

NOTE: If the location of the original plug weld holes can not be determined, space the plug weld holes every 40 mm (1 1/2 in).

1. Drill 8 mm (5/16 in) for plug welding along the edges of the body rear end panel as noted from the original panel.
2. Clean and prepare the attaching surfaces for welding.

Fig. 122: Body Rear End Panel

Courtesy of GENERAL MOTORS COMPANY

3. Position the body rear end panel on the vehicle.
4. Verify the fit of the body rear end panel.
5. Clamp the body rear end panel into position.

6. Plug the weld accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to **Anti-Corrosion Treatment and Repair** .
8. Paint the repaired area. Refer to **Basecoat/Clearcoat Paint Systems** .
9. Install all related panels and components.
10. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
11. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

DESCRIPTION AND OPERATION

DUAL PHASE STEEL

This information provides repair recommendations and general guidelines for steel classified as Dual Phase Steel with a tensile strength up to and including 800 MPa, also known as DP.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

NOTE: **The use of heat to repair damage is not recommended for this classification of**

steel.

Recommended Repairs

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- This type of steel can be used as a sleeve or backer plate, when recommended in a specific sectioning procedure.
- Squeeze resistance spot welding can be used to replace factory spot welds, where applicable.
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG brazing can be used on this type of steel.

HIGH STRENGTH LOW ALLOY STEEL

This information provides repair recommendations and general guidelines for steel classified as High Strength Low Alloy Steel, also known as HSLA. This type of steel normally has a tensile strength range from 300-700 MPa.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Recommended Repairs

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Controlled use of heat can be used to repair damage, if the heat does not exceed 650° C (1200° F). The heat should be applied a maximum of 2 times, for up to 90 seconds.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- This type of steel can be used as a sleeve or backer plate, during sectioning procedures.
- Squeeze resistance spot welding can be used to replace factory spot welds, where applicable.
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

MILD STEEL

This information provides repair recommendations and general guidelines for steel classified as Mild Steel. This type of steel normally has a tensile strength less than 270 MPa. This includes the common steel names of:

- Mild Steel
- Bake Hardenable Steel (BH)
- Solid Solution Strengthened Steel

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Recommended Repairs

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Controlled use of heat can be used to repair damage, if the heat does not exceed 650° C (1200° F). The heat should be applied a maximum of 2 times, for up to 90 seconds.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- This type of steel can be used as a sleeve or backer plate, when recommended in a specific sectioning procedure.
- Squeeze resistance spot welding can be used to replace factory spot welds, where applicable
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

ULTRA HIGH STRENGTH DUAL PHASE STEEL

This information provides repair recommendations and general guidelines for steel classified as Ultra High Strength Dual Phase Steel (Dual Phase Steel with a tensile strength greater than 800 MPa), also known as DPX.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

NOTE:

- **Repair of this type of steel is not recommended.**
- **This type of steel should be replaced at factory joints only. Sectioning or partial replacement is not recommended.**
- **The use of heat to repair damage is not recommended for this type of steel.**
- **Stitch welding is not recommended for this type of steel.**
- **This classification of steel can not be used as a backing reinforcement or a sleeve for a sectioning joint, unless a specific procedure is available.**

Recommended Repairs

- Squeeze resistance spot welding can be used to replace factory spot welds, where applicable.
- MIG plug welding can be used to replace factory spot welds.
- MIG brazing can be used to replace factory spot welds.

F1	ABS3	F1UA Fuse	5A	X90 Assembly Plant ABS Data Connector
F2	-	F2UA Fuse	-	Not Used
F3	VOLTAGE SENSING	F3UA Fuse	5A	K9 Body Control Module
F4	CNSTR	F4UA Fuse	10A	Q13 Evaporative Emissions Vent Solenoid Valve
F5	AOS	F5UA Fuse	10A	K85 Passenger Presence Module
F6	ECM/TCM1	F6UA Fuse	15A	K20 Engine Control Module, K71 Transmission Control Module
F7	-	F7UA Fuse	-	Not Used
F8	-	F8UA Fuse	-	Not Used
F9	-	F9UA Fuse	-	Not Used
F10	HORN	F10UA Fuse	15A	P12 Horn
F11	HDLP HI LT	F11UA Fuse	15A	E13L Headlamp - Left
F12	HDLP HI RT	F12UA Fuse	15A	E13R Headlamp - Right
F13	FRT FOG	F13UA Fuse	15A	E29L Fog Lamp - Left Front, E29R

				Fog Lamp - Right Front
F14	-	F14UA Fuse	-	Not Used
F15	FRT WPR	F15UA Fuse	30A	G24 Windshield Washer pump
F16	REAR DEFOG	F16UA Fuse	20A	E18 Rear Defogger Grid
F17	MIR HTR	F17UA Fuse	15A	A9A Outside Rearview Mirror - Driver, A9B Outside Rearview Mirror - Passenger
F18	EMIS 1	F18UA Fuse	15A	Heated Oxygen Sensor 1, B5B Heated Oxygen Sensor 2, B75B Mass Air Flow/Intake Air Temperature Sensor, E41 Engine Coolant Thermostat Heater, Q12 Evaporative Emission Purge Solenoid Valve.
F19	IGN	F19UA Fuse	20A	Q17A Fuel Injector 1, Q17B Fuel Injector 2, Q17C Fuel Injector 3, Q17D Fuel Injector 4, Ignition Coil 1, T8B Ignition Coil 2, T8C Ignition Coil 3, T8D Ignition Coil 4
F20	EMIS2	F20UA Fuse	15A	K20 Engine Control Module, KR20C Low Speed Cooling Fan Relay, KR20D High Speed Cooling Fan Relay
F21	A/C	F21UA Fuse	10A	Q2 A/C Compressor Clutch
F22	FAN LO	F22UA Fuse	20A	KR20C Cooling Fan Low Speed Relay
F23	ECM/TCM 2	F23UA Fuse	15A	K20 Engine Control Module, K71 Transmission Control Module
F24	-	F24UA Fuse	-	Not Used
F25	-	F25UA Fuse	10A	Not Used
F26	-	Fuse F26UA	-	Not Used
F27	LO VAC SW	F27UA Fuse	10A	B19C Brake Booster Vacuum Switch
F28	FUEL PUMP	F28UA Fuse	15A	KR23A Fuel Pump Relay
F29	WSW	F29UA Fuse	10A	KR11 Windshield Washer Pump Relay, KR6 Rear Window Washer Pump Relay
F30	REAR WPR	F30UA Fuse	15A	KR7 Rear Wiper Relay, M45 Rear Wiper Motor
F31	ABS1	F31UA Fuse	40A	K17 Electronic Brake Control Module
F32	ABS2	F32UA Fuse	50A	K17 Electronic Brake Control Module
F33	STRTR	F33UA Fuse	35A	KR27 Starter Relay
F34	-	F34UA Fuse	-	Not Used
F35	-	F35UA Fuse	-	Not Used
F36	IEC	F36UA Fuse	30A	P16 Instrument Cluster, P17 Info Display Module

Relays

KR5	REAR DEFOG RLY	KR5 Rear Defogger Relay	-	F16UA, F17UA
KR20C	FAN LO RLY	KR20C Cooling Fan Low Speed Relay	-	R10 Cooling Fan Resistor
KR20D	FAN HI RLY	KR20D Cooling Fan High Speed Relay	-	G10 Cooling Fan Motor
KR23A	FUEL PUMP RLY	KR23A Fuel Pump Relay	-	G12 Fuel Pump
KR27	STRTR RLY	KR27 Starter Relay	-	M64 Starter Motor
KR46	FRT FOG RLY	KR46 Front Fog Lamp Relay	-	F13UA
KR48	HDLR HI RLY	KR48 Headlamp High Beam Relay	-	F11UA, F12UA
KR73	RUN/CRANK RLY	KR73 Ignition Main Relay	-	F23UA, F24UA, F25UA, F26UA, F27UA, F28UA, F36UA, KR23A, F30DA, F31DA,
KR75	ENG RLY	KR75 Engine Controls Ignition Relay	-	F18UA, F19UA, F20UA
KR157	TCM RLY	KR157 Transmission Control Relay	-	F14UA

NOTE:

Relays listed below are non-serviceable Printed Circuit Board (PCB) relays and are internal to the block.

-	HORN RLY	KR3 Horn Relay	-	F10UA
-	REAR WSW RLY	KR6 Rear Window Washer Pump Relay	-	G19 Rear Window Washer Pump
-	FRT WSW RLY	KR11 Windshield Washer Pump Relay	-	G24 Windshield Washer pump
-	FRT WPR CTRL RLY	KR12B Windshield Wiper Relay	-	M75 Windshield Wiper Motor
-	FRT WPR SPD RLY	KR12C Windshield Wiper Speed Control Relay	-	M75 Windshield Wiper Motor
-	A/C RLY	KR29 A/C Compressor Clutch Relay	-	F21UA
-	REAR WPR RLY	KR7 Rear Wiper Relay	-	F30UA

-	REAR WSW RLY	KR6 Rear Window Washer Pump Relay	-	F29UA

X51A FUSE BLOCK - INSTRUMENT PANEL X1

Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 2005400-2
- Service Connector: Service by Harness - See Part Catalog
- Description: 1-Way F 9.5 Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray	Core Crimp	Insulation Crimp
I	Not Available	J-35616-21 (RD)	J-38125-221	Not Available	Not Available	Not Available	Not Available

X51A Fuse Block - Instrument Panel X1

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	10	RD/GN	2740	Battery Positive Voltage	I	-

B14C	Transmission Turbine Speed Sensor	MNG	On the transmission, attached to the transmission side cover	<u>Rear of Engine Components</u>	<u>B14C Tra Input Sha Sensor (M)</u>

B16	Backup Lamp Switch	MFN/MX2	On the transmission, above the side cover	<u>Manual Transmission Components (MFM/MX2)</u>	<u>B16 Backup Switch</u>
B18	Battery Current Sensor	-	In the engine compartment, left front, forward of battery, mounted to battery negative cable	<u>Left Side of Engine Compartment Components</u>	<u>B18 Battery Sensor</u>
B19C	Brake Booster Vacuum Switch	-	At the rear of the engine compartment, driver side, on the brake booster	-	<u>B19C Brake Vacuum Switch</u>
B20	Brake Fluid Level Switch	-	Left rear of engine compartment, on the brake fluid reservoir	<u>Left Side of Engine Compartment Components</u>	<u>B20 Brake Switch (R)</u>
B22	Brake Pedal Position Sensor	MFM	In the passenger compartment, under the driver side of the instrument panel, above the brake pedal	-	<u>B22 Brake Position Sensor</u>
B23E	Camshaft Position Sensor	-	Left side of the cylinder head, at the intake camshaft	<u>Rear of Engine Components</u>	<u>B23E Camshaft Sensor - Intake</u>
B23F	Camshaft Position Sensor Exhaust	-	In the engine compartment, on the left rear corner of the cylinder head	<u>Rear of Engine Components</u>	<u>B23F Camshaft Sensor - Exhaust</u>
			In the		

B24	Cellular Phone Microphone	UE1	passenger compartment, at the front of the headliner, next to the dome lamp	<u>Headliner Components (UE1)</u>	<u>B24 Cellular Phone Microphone</u>
B25B	Clutch Pedal Position Sensor	MFM	In the passenger compartment, under the driver side of the instrument panel, above the clutch pedal	-	<u>B25B Clutch Pedal Position Sensor</u>
B26	Crankshaft Position Sensor	(LFM/LL0+M4M)	In the engine compartment, front of the transmission	<u>Front of Engine Components</u>	<u>B26 Crankshaft Position Sensor (LFM/LL0+M4M)</u>
B26	Crankshaft Position Sensor	(LL0-M4M)	In the engine compartment, front of the transmission	<u>Front of Engine Components</u>	<u>B26 Crankshaft Position Sensor (LL0-M4M)</u>
B28D	Door Ajar Switch - Driver	-	In the driver door jamb, in the B-pillar, below the door latch striker	<u>Left and Front of the Passenger Compartment Components</u>	<u>B28D Door Ajar Switch - Driver</u>
B28LR	Door Ajar Switch - Left Rear	-	In the left rear door jamb, below the door latch striker	<u>Left and Front of the Passenger Compartment Components</u>	<u>B28LR Door Ajar Switch - Left Rear</u>
B28P	Door Ajar Switch - Passenger	-	In the front passenger door jamb, in the B-pillar, below the door latch striker	<u>Left and Rear of the Passenger Compartment Components</u>	<u>B28P Door Ajar Switch - Passenger</u>
B28RR	Door Ajar Switch - Right Rear	-	In the right rear door jamb, below the door latch striker	-	<u>B28RR Door Ajar Switch - Right Rear</u>

B34A	Engine Coolant Temperature Sensor 1	-	In the engine compartment, on the front of the cylinder head, near the thermostat	<u>Rear of Engine Components</u>	<u>B34A Engine Temperature</u>
B34B	Engine Coolant Temperature Sensor 2	EVP	In the engine compartment, in the right radiator tank	<u>Front of Engine Compartment Components</u>	<u>B34B Engine Temperature</u>
B37	Engine Oil Pressure Switch	-	At the rear of the engine, near the generator	<u>Front of Engine Components</u>	<u>B37 Engine Pressure</u>
B39	A/C Evaporator Temperature Sensor	C60	In the passenger compartment, behind the passenger side of the instrument panel	<u>HVAC Assembly Components</u>	<u>B39 A/C Temperature</u>
B46	Fuel Level Sensor	-	In the vehicle underbody, below rear seats, part of fuel pump and level sensor assembly, mounted to fuel tank	-	
B52A	Heated Oxygen Sensor 1	-	In the engine compartment, on the front of engine, in the exhaust manifold	<u>Front of Engine Components</u>	<u>B52A Heated Oxygen Sensor 1</u>
B52B	Heated Oxygen Sensor 2	-	In the engine compartment, below the catalytic converter, in the exhaust pipe	<u>Front of Engine Components</u>	<u>B52B Heated Oxygen Sensor 2</u>

B55	Hood Ajar Switch	UTJ(EF7/Z49)	In the engine compartment, to the left of the hood latch	-	<u>B55 Hood</u>
B59	Front Impact Sensor	EF7/Z49	In the engine compartment, near the hood latch	-	<u>B59 Front Sensor</u>
B59L	Front Impact Sensor - Left	EF7/Z49	In the engine compartment, front left of center, mounted to rear of radiator support, at top	-	<u>B59L Front Sensor</u>
B59R	Front Impact Sensor - Right	EF7/Z49	In the engine compartment, front right of center, mounted to rear of radiator support, at top	-	<u>B59R Front Sensor - Right</u>
B60	Passenger Presence Sensor	AL0	In the passenger compartment, right forward of center, in the passenger seat cushion, between seat cover and seat pad	<u>Right Front Seat Components</u>	
B61P	Seat Belt Tension Sensor - Passenger	AL0	In the passenger compartment, in the passenger seat belt buckle	<u>Right Front Seat Components</u>	
			In the driver	<u>Driver Door Components (Left Hand</u>	

B63LF	Side Impact Sensor - Left Front	AYF	door, near middle, mounted to door beam	<u>Drive)</u> • <u>Passenger Door Components (Right Hand Drive)</u>	<u>B63LF Si Sensor - I</u>
B63LR	Side Impact Sensor - Left Rear	AY0	In the passenger compartment, left rear, near outboard seat belt anchor bolt	-	<u>B63LR Si Sensor - I</u>
B63LR	Side Impact Sensor - Left Rear	AYF	In the passenger compartment, right rear, near outboard seat belt anchor bolt	-	<u>B63LR Si Sensor - I</u>
B63RF	Side Impact Sensor - Right Front	AYF	In the passenger door, near middle, mounted to door beam	• <u>Driver Door Components (Right Hand Drive)</u> • <u>Passenger Door Components (Left Hand Drive)</u>	<u>B63RF Si Sensor - F</u>
B63RR	Side Impact Sensor - Right Rear	AYF	In the passenger compartment, at the bottom front of the right B-pillar	-	<u>B63RR Si Sensor - F</u>
B68	Knock Sensor	-	On the rear side of the engine block, near the middle of the engine	<u>Rear of Engine Components</u>	<u>B68 Knoc</u>
B69	Liftgate Ajar Switch	-	In the cargo area, near the bottom center of the liftgate	<u>Liftgate Components (1/2)</u>	<u>B69 Liftg Switch</u>
	Manifold Absolute		In the engine compartment, on the left	<u>Rear of Engine</u>	<u>B74 Mani</u>

B74	Pressure Sensor	-	side of the intake manifold	<u>Components</u>	<u>Pressure</u>
B75B	Mass Air Flow/Intake Air Temperature Sensor	-	In the engine compartment, on the inlet air duct	<u>Rear of Automatic Transmission Components (M4M)</u>	<u>B75B Mass Air Flow/Intake Air Temperature Sensor</u>
B78G	Rear Object Sensor - Left Outer	(UD7)	At the rear of the vehicle, in the left center of the bumper fascia	<u>Rear of Vehicle Components</u>	<u>B78G Rear Object Sensor - Left Outer (UD7)</u>
B78H	Rear Object Sensor - Right Outer	(UD7)	At the rear of the vehicle, in the Right center of the bumper fascia	<u>Rear of Vehicle Components</u>	<u>B78H Rear Object Sensor - Right Outer (UD7)</u>
B80	Park Brake Switch	-	In the passenger compartment, near the center console	<u>Right Side of the Passenger Compartment Components</u>	<u>B80 Park Brake Switch</u>
B81	Park/Neutral Position Switch	MNG/M4M	On the transmission, attached to the top front of the transmission case	<u>Front of Engine Components</u> <u>Front of Automatic Transmission Components (M4M)</u>	<u>B81 Park/Neutral Position Switch</u> <u>B81 Park/Neutral Position Switch</u>
B87	Rearview Camera	UVC	At the rear of vehicle, mounted to liftgate above license plate, left of center	<u>Rear of Vehicle Components</u>	<u>B87 Rearview Camera (UVC)</u>
B88D	Seat Belt Switch - Driver	AJ3/AK5/AJ7/AYO/AYF	In the passenger compartment, in the driver seat belt buckle	<u>Right Front Seat Components</u>	<u>B88D Seat Belt Switch - Driver</u>
			In the passenger compartment,		

B88P	Seat Belt Switch - Passenger	TFC(EF7/Z49) A YF	in the passenger seat belt buckle	<u>Right Front Seat Components</u>	<u>B88P Sea Pa</u>
B107	Accelerator Pedal Position Sensor	-	In the passenger compartment, under the instrument panel near the accelerator pedal	-	<u>B107 Acc Position S</u>
B115	Vehicle Speed Sensor	M4M	On the transmission, attached to the top rear of the transmission case	<u>Rear of Automatic Transmission Components (M4M)</u>	<u>B115 Veh Sensor (M</u>
B115	Vehicle Speed Sensor	MFM/MX2	On the transmission, attached to the top rear of the transmission case	<u>Manual Transmission Components (MFM/MX2)</u>	<u>B115 Veh Sensor (M</u>
B119	Multi-axis Acceleration Sensor	FX3	In the passenger compartment, below the instrument panel near the center console	<u>Left and Front of the Passenger Compartment Components</u>	<u>B119 Mul Accelerat</u>
B137	Power Steering Shaft Torque Sensor	NJ1	In the passenger compartment, mounted to lower steering column	• <u>Steering Column Components (Left Hand Drive)</u> • <u>Steering Column Components (Right Hand Drive)</u>	
			Under the	<u>WHEELS/VEHICLE</u>	

B150	Fuel Tank Pressure Sensor	-	vehicle, on the fuel tank	<u>UNDERBODY COMPONENT VIEWS</u>	<u>B150 Fuel Pressure</u>
B153D	Seat Belt Buckle - Driver	-	In the passenger compartment, left forward of center, mounted to the inboard side of the driver seat	<u>Left Front Seat Components</u>	
B153P	Seat Belt Buckle - Passenger	-	In the passenger compartment, right forward of middle, mounted to the inboard side of the passenger seat	<u>Right Front Seat Components</u>	<u>B88P Seat Passenger</u>
C1	Battery	-	In the engine compartment, left side, near front, mounted to battery tray, below battery cover	-	
C3	Telematics Communication Interface Control Module Battery	UE1	In the passenger compartment, under the passengers seat	-	<u>C3 Telem Communi Interface Module B</u>
E6	Center High Mounted Stop Lamp	-	In the passenger compartment, at the top of the liftgate	<u>Liftgate Components (1/2)</u>	<u>E6 Center Mounted</u>
E13L	Headlamp - Left High Beam	-	Outside the front of the vehicle, the inner lamp of the left headlamp	<u>Front of Vehicle</u>	<u>E13L Hea</u>

			assembly		
E14R	Headlamp - Right Low Beam	-	At the front of vehicle, front right, within the headlamp assembly - right, bulb at center	<u>Front of Vehicle</u>	<u>E13R Headlamp - Right</u>
E4LF	Turn Signal Lamp - Left Front	-(CW1/EF7/Z49)	In the left front corner of the vehicle, in the left headlamp assembly	<u>Front of Vehicle</u>	<u>E4LF Turn Signal Lamp - Left Front</u>
E4N	Park/Turn Signal Lamp - Left	CW1	In the left front corner of the vehicle, in the left headlamp assembly	<u>Front of Vehicle</u>	<u>E4N Park/Turn Signal Lamp - Left</u>
E4P	Park/Turn Signal Lamp - Right	CW1	In the right front corner of the vehicle, in the right headlamp assembly	<u>Front of Vehicle</u>	<u>E4P Park/Turn Signal Lamp - Right</u>
E4RF	Turn Signal Lamp - Right Front	-(CW1/EF7/Z49)	In the right front corner of the vehicle, in the right headlamp assembly	<u>Front of Vehicle</u>	<u>E4RF Turn Signal Lamp - Right Front</u>
E4Y	Turn Signal Repeater Lamp - Left	T90	Near the left front corner of the vehicle, at the rear of the fender	-	<u>E4Y Turn Signal Repeater (T90)</u>
E4Z	Turn Signal Repeater Lamp - Right	T90	Near the right front corner of the vehicle, at	-	<u>E4Z Turn Signal Repeater</u>

			the rear of the fender		<u>(T90)</u>
E5A	Backup Lamp - Left	-	In the left rear corner of the vehicle, in the left rear lamp assembly	<u>Rear of Vehicle Components</u>	
E5AA	Tail/Stop Lamp - Left	-	In the left rear corner of the vehicle, in the left rear lamp assembly	<u>Rear of Vehicle Components</u>	
E5AB	Tail/Stop Lamp - Right	-	In the right rear corner of the vehicle, in the right rear lamp assembly	<u>Rear of Vehicle Components</u>	
E5AC	Tail/Turn Signal Lamp - Left	-	In the left rear corner of the vehicle, in the left rear lamp assembly	<u>Rear of Vehicle Components</u>	
E5AD	Tail/Turn Signal Lamp - Right	-	In the right rear corner of the vehicle, in the right rear lamp assembly	<u>Rear of Vehicle Components</u>	
E5B	Backup Lamp - Right	without U05	In the right rear corner of the vehicle, in the right rear lamp assembly	<u>Rear of Vehicle Components</u>	
E6	Center High Mounted Stop Lamp	-	In the passenger compartment, at the top of the liftgate	<u>Rear of Vehicle Components</u>	<u>E6 Center Mounted</u>
E7L	License Plate Lamp - Left	-	On the outside of the liftgate, near the outside	<u>Rear of Vehicle Components</u>	<u>E7 Licens</u>

			handle		
E7	License Plate Lamp	-	On the outside of the liftgate, near the outside handle	<u>Rear of Vehicle Components</u>	<u>E7 Licens</u>
E8S	Rear Compartment Courtesy Lamp	U25	In the rear compartment, on the left side	-	<u>E8S Rear Courtesy</u>
E13L	Headlamp - Left	-	On the outside of the vehicle, at the left front corner of the vehicle	<u>Front of Vehicle</u>	<u>E13L He</u>
E13LA	Headlamp Assembly - Left	-	On the outside of the vehicle, at the left front corner of the vehicle	<u>Front of Vehicle</u>	
E13R	Headlamp - Right	-	On the outside of the vehicle, at the right front corner of the vehicle	<u>Front of Vehicle</u>	<u>E13R Hea</u>
E13RA	Headlamp Assembly - Right	-	On the outside of the vehicle, at the right front corner of the vehicle	<u>Front of Vehicle</u>	
E14B	Seat Heating Element - Driver Cushion	C37 or C38	In the passenger compartment, inside the driver seat cushion	• <u>Left Front Seat Components</u> • <u>Right Front Seat Components</u>	<u>E14B Sea Element - Cushion</u>
E14D	Seat Heating Element - Passenger Cushion	C37 or C38	In the passenger compartment, inside the front passenger seat cushion	• <u>Left Front Seat Components</u> • <u>Right Front Seat Components</u>	<u>E14D Sea Element - Cushion</u>

E17D	Outside Rearview Mirror Glass - Driver	-	On outside of driver door, front middle, within outside rearview mirror - driver	• <u>Driver Door Components (Left Hand Drive)</u> • <u>Driver Door Components (Right Hand Drive)</u>	
E17P	Outside Rearview Mirror Glass - Passenger	-	On outside of passenger door, front middle, within outside rearview mirror - passenger	• <u>Passenger Door Components (Left Hand Drive)</u> • <u>Driver Door Components (Left Hand Drive)</u>	
E18	Rear Defogger Grid	C50	Inside the passenger compartment, attached to the rear window	<u>Liftgate Components (1/2)</u>	• <u>E18 Def</u> • <u>E18 Def</u>
E29LF	Fog Lamp - Left Front	-	On the vehicle exterior, at the left front corner of the vehicle	<u>Front of Vehicle</u>	• <u>E29 - Le</u> • <u>E29 LAI FR</u>
E29RF	Fog Lamp - Right Front	-	On the vehicle exterior, at the right front corner of the vehicle	<u>Front of Vehicle</u>	• <u>E29 - Ri (T3)</u>
E36AH	Dome Lamp	-	In the passenger compartment, at the front center of the headliner	• <u>Headliner Components (UE1)</u> • <u>Headliner Components (-UE1)</u>	<u>E36AH D</u>
E41	Engine Coolant Thermostat Heater	-	In the engine compartment, on the left side of the engine, on	<u>Rear of Engine Components</u>	<u>E41 Engi Thermost</u>

			the thermostat housing		
E42L	Tail Lamp Assembly - Left	-	At the rear of vehicle, rear left, mounted to body	-	
E42R	Tail Lamp Assembly - Right	-	At the rear of vehicle, rear right, mounted to body	-	
F101	Passenger Instrument Panel Air Bag	AYF	In the passenger compartment, in the passenger side of the instrument panel	<u>Instrument Panel and Center Console Components</u>	<u>F101 Passenger Instrument Bag</u>
F105L	Roof Rail Air Bag - Left	AYO/AYF	In the passenger compartment, on the left side of the roof	-	<u>F105L Roof Rail Air Bag - Left</u>
F105R	Roof Rail Air Bag - Right	AYO/AYF	In the passenger compartment, on the right side of the roof	<u>Right Side of the Passenger Compartment Components</u>	<u>F105R Roof Rail Air Bag - Right</u>
F106D	Seat Air Bag - Left Front	AJ7/AYO/AYF	In the passenger compartment, in the left front seat back	<u>Left Front Seat Components</u>	<u>F106D Seat Air Bag - Left Front</u>
F106LR	Side Air Bag - Left Rear	AJ7/AYO/AYF	In the passenger compartment, on the left side of the rear seat back	-	<u>F106LR Side Air Bag - Left Rear</u>
			In the passenger compartment,	<u>Right Front Seat</u>	<u>F106P Side Air Bag - Right Front</u>

F106P	Seat Air Bag - Right Front	AJ7/AYO/AYF	in the right front seat back	<u>Components</u>	<u>Passenger</u>
F106RR	Side Air Bag - Right Rear	AJ7/AYO/AYF	In the passenger compartment, on the right side of the rear seat back	-	<u>F106RR S</u> <u>Right Rea</u>
F107	Steering Wheel Air Bag	-	In the passenger compartment, in the steering wheel	<u>Instrument Panel</u> <u>and Center Console</u> <u>Components</u>	• <u>F10 Wh</u> • <u>F10 Wh</u>
F112D	Seat Belt Retractor Pretensioner - Driver	AWT	In the passenger compartment, at the bottom of the left B-pillar	• <u>Right Side of the Passenger Compartment Components</u>	<u>F112D Se</u> <u>Retractor Driver</u>
F112P	Seat Belt Retractor Pretensioner - Passenger	AID or AWS	In the passenger compartment, at the bottom of the right B-pillar	• <u>Right Side of the Passenger Compartment Components</u>	<u>F112P Se</u> <u>Retractor Passenger</u>
F113D	Seat Belt Anchor Pretensioner - Driver	AYF	In the passenger compartment, on the lower outside of the driver seat, mounted to the floor	-	<u>F113D Se</u> <u>Pretensio</u>
F113P	Seat Belt Anchor Pretensioner - Passenger	AYF	In the passenger compartment, on the lower outside of the passenger seat, mounted to the floor	-	<u>F113P Se</u> <u>Pretensio</u> <u>Passenger</u>
			In the passenger compartment,		

F114D	Knee Air Bag - Driver	AYF	at the bottom of the driver side of the instrument panel	<u>Instrument Panel and Center Console Components</u>	<u>F114D Kr Driver</u>
F114P	Knee Air Bag - Passenger	AYF	In the passenger compartment, at the bottom of the passenger side of the instrument panel	<u>Instrument Panel and Center Console Components</u>	<u>F114P Kr Passenger</u>
F122	A/C Compressor Temperature Switch	C60	In the engine compartment, mounted into the back of A/C compressor	-	
G1	A/C Compressor	C60	In the engine compartment, front lower right of engine, mounted to engine block	-	
G10	Cooling Fan Motor	-	In the engine compartment, attached to the radiator shroud	<u>Front of Engine Compartment Components</u>	<u>G10 Cooli</u>
G12	Fuel Pump	-	In the vehicle underbody, below rear seats, part of fuel pump and level sensor assembly, within the fuel tank	-	
G13	Generator	-	In the engine compartment, on the right rear side of the engine	<u>Rear of Engine Components</u>	<u>G13 Gene</u>

G19	Rear Window Washer Pump	CD6	In the engine compartment, in the left front corner near the washer fluid reservoir	<u>Right Side of Engine Compartment Components</u>	<u>G19 Rear Washer P</u>
G24	Windshield Washer Pump	-	In the engine compartment, in the left front corner, near the washer fluid reservoir	<u>Right Side of Engine Compartment Components</u>	<u>G24 Wind Washer P</u>
K9	Body Control Module	-	In the passenger compartment, instrument panel	-	• <u>K9</u> <u>Mod</u> • <u>K9</u> <u>Mod</u> • <u>K9</u> <u>Mod</u> • <u>K9</u> <u>Mod</u> • <u>K9</u> <u>Mod</u> • <u>K9</u> <u>Mod</u> • <u>K9</u> <u>Mod</u>

K20	Engine Control Module	LL0-M4M	In the engine compartment, left front corner, near the battery	-	• <u>K20</u> <u>Con</u> <u>X1</u> • <u>K20</u> <u>Con</u> <u>X2</u>
K33	HVAC Control Module	-	In the passenger compartment, in the center of the instrument panel, behind the HVAC controls	<u>Instrument Panel and Center Console Components</u>	<u>K33 HVA</u> <u>Module</u>
K36	Inflatable Restraint Sensing and Diagnostic Module	-	In the passenger compartment, under the driver seat	<u>Left and Front of the Passenger Compartment Components</u>	• <u>K36</u> <u>Res</u> <u>and</u> <u>Mod</u> • <u>K36</u> <u>Res</u> <u>and</u> <u>Mod</u>
K41R	Rear Parking Assist Control Module	UD7	In left rear corner of body behind rear fascia	-	<u>K41R Rea</u> <u>Assist Co</u>
K43	Power Steering Control Module	NJ1	In the passenger compartment, behind the instrument panel	• <u>Steering Column Components (Left Hand Drive)</u> • <u>Steering Column Components (Right Hand Drive)</u>	• <u>K43</u> <u>Stee</u> <u>Mod</u> • <u>K43</u> <u>Stee</u> <u>Mod</u> • <u>K43</u> <u>Stee</u> <u>Mod</u> • <u>K43</u> <u>Stee</u> <u>Mod</u>
K71	Transmission Control	M4M	In the passenger compartment, behind the instrument	-	• <u>K71</u> <u>Con</u> <u>X1</u>

	Module		panel located on the left side of the brake pedal		• <u>K71 Con X2</u>
K71	Transmission Control Module	MFL/MNG	In the passenger compartment, behind the instrument panel located on the left side of the brake pedal	-	• <u>K71 Con X1</u> • <u>K71 Con X2</u>
K73	Telematics Communication Interface Control Module	UE1	In the passenger compartment, under the driver's seat	-	• <u>K73 Con Inte Mod</u> • <u>K73 Con Inte Mod</u>
K77	Remote Control Door Lock Receiver	UTJ/UJM	In the passenger compartment, behind the center of the instrument panel	<u>Left and Rear of the Passenger Compartment Components</u>	<u>K77 Remote Door Lock</u>
K85	Passenger Presence Module	AYF	Under passenger seat mounted to seat frame	-	<u>K85 Passenger Module (L</u>
K89	Immobilizer Control Module	-	In the passenger compartment, behind the instrument panel near the steering column	-	<u>K89 Immobilizer Control M</u>
M4	Air Temperature Door Actuator	-	In the passenger compartment, behind the center of the instrument	<u>HVAC Assembly Components</u>	<u>M4 Air In Actuator</u>

			panel		
M7	Transmission Shift Lock Control Solenoid Actuator		In the passenger compartment, center, in the center console, part of the transmission shift lever	-	
M8	Blower Motor	-	In the passenger compartment, behind the passenger side of the instrument panel	<u>HVAC Assembly Components</u>	<u>M8 Blower Motor</u>
M9	Brake Booster Pump Motor	-	At the rear of the engine compartment, driver side, below the master cylinder	<u>Left Side of Engine Compartment Components</u>	<u>M9 Brake Booster Pump Motor</u>
M14B	Door Lock Actuator - Liftgate	A91	In the passenger compartment, inside the liftgate	-	<u>M14B Door Lock Actuator</u>
M38	Power Steering Motor	NJ1	In passenger compartment mounted to steering column.	• <u>Steering Column Components (Left Hand Drive)</u> • <u>Steering Column Components (Right Hand Drive)</u>	
M45	Rear Wiper Motor	-	In the vehicle interior, inside the liftgate	-	<u>M45 Rear Wiper Motor</u>
			In the engine compartment,	<u>Rear of Engine</u>	

M64	Starter Motor	-	on the rear side of the engine	<u>Components</u>	<u>M64 Starter Motor</u>
M74D	Window Motor - Driver	A32 or AE3	In the passenger compartment, inside the driver door	• <u>Driver Door Components (Left Hand Drive)</u> • <u>Driver Door Components (Right Hand Drive)</u>	<u>M74D Window Motor - Driver</u>
M74LR	Window Motor - Left Rear	AE3	In the passenger compartment, inside the left rear door	-	<u>M74LR Window Motor - Left Rear</u>
M74P	Window Motor - Passenger	A32 or AE3	In the passenger compartment, inside the passenger door	• <u>Passenger Door Components (Left Hand Drive)</u> • <u>Passenger Door Components (Right Hand Drive)</u>	<u>M74P Window Motor - Passenger</u>
M74RR	Window Motor - Right Rear	AE3	In the passenger compartment, inside the right rear door	<u>Right Rear Door Components</u>	<u>M74RR Window Motor - Right Rear</u>
M75	Windshield Wiper Motor	-	In the cowl panel, at the base of the windshield	<u>Left Side of Engine Compartment Components</u>	<u>M75 Windshield Wiper Motor</u>
M77D	Outside Rearview Mirror Motor - Driver	-	On outside of driver door, front middle, within outside rearview mirror - driver, forward of mirror glass	-	
			On outside of passenger		

M77P	Outside Rearview Mirror Motor - Passenger	-	door, front middle, within outside rearview mirror - passenger, forward of mirror glass	-	
M93	Key Capture Solenoid Actuator	-	In the passenger compartment, on the steering column, near the ignition switch	-	<u>M93 Key Solenoid</u>
P2	Transmission Shift Lever Position Indicator	-	In the passenger compartment, center near front, at top of center console, mounted to shift lever bezel	-	
P12	Horn	-	In the engine compartment, near the left front corner of the vehicle	-	<u>P12 Horn</u>
P16	Instrument Cluster	-	In the passenger compartment, in the driver side of the instrument panel	<u>Instrument Panel and Center Console Components</u>	<u>P16 Instr</u>
P17	Info Display Module	-	In the passenger compartment, in the Center of the instrument panel, above radio	<u>Instrument Panel and Center Console Components</u>	<u>P17 Info I Module</u>

P19J	Speaker - Left Instrument Panel	UF7/UH7/UM7/UCH	In the passenger compartment, on the left side of the instrument panel	<u>Instrument Panel and Center Console Components</u>	<u>P19J Speaker Instrument Panel</u>
P19L	Speaker Left Rear Compartment	-	In the passenger compartment, in the left rear compartment trim panel, near the strut tower	-	<u>P19J Speaker Rear Compartment</u>
P19W	Speaker Right Instrument Panel	UF7/UH7/UM7/UCH	In the passenger compartment, on the right side of the instrument panel	-	<u>P19W Speaker Instrument Panel</u>
P19Y	Speaker Right Rear Compartment	-	In the passenger compartment, in the right rear compartment trim panel, near the strut tower	-	<u>P19Y Speaker Rear Compartment</u>
P28	Speaker - Parking Assist	UD7	In left rear corner of body behind rear fascia	-	<u>P28 Speaker Parking Assist (UI)</u>
Q2	A/C Compressor Clutch	C60	In the engine compartment, on the A/C compressor	<u>Front of Engine Components</u>	<u>Q2 A/C Compressor Clutch</u>
Q6E	Camshaft Position Actuator Solenoid Valve - Intake	-	In the engine compartment, on the upper, right front of the engine	<u>Front of Engine Components</u>	<u>Q6E Camshaft Actuator - Intake</u>
			In the engine compartment,		<u>Q6F Camshaft Actuator - Exhaust</u>

Q6F	Camshaft Position Actuator Solenoid Valve - Exhaust	-	on the upper, right rear of the engine	<u>Front of Engine Components</u>	<u>Actuator Intake</u>
Q5	Brake Pressure Modulator	-	At the rear of the engine compartment, driver side, mounted to the electronic brake control module	-	
Q8	Control Solenoid Valve Assembly	-	In the engine compartment, left middle, in automatic transmission, at front of case, behind front cover	-	
Q12	Evaporative Emission Purge Solenoid Valve	-	In the engine compartment, on the rear side of the engine	<u>Rear of Engine Components</u>	<u>Q12 Evap Emission Solenoid Valve</u>
Q13	Evaporative Emission Vent Solenoid Valve	-	Under the vehicle, on the top of the fuel tank	<u>Fuel Tank Components</u>	<u>Q13 Evap Emission Valve</u>
Q17A	Fuel Injector 1	-	In the engine compartment, on the front side of the engine	<u>Top of Engine Components</u>	<u>Q17A Fuel Injector</u>
Q17B	Fuel Injector 2	-	In the engine compartment, on the front side of the engine	<u>Top of Engine Components</u>	<u>Q17B Fuel Injector</u>
Q17C	Fuel Injector 3	-	In the engine compartment, on the front side of the engine	<u>Top of Engine Components</u>	<u>Q17C Fuel Injector</u>
Q17D	Fuel Injector 4	-	In the engine compartment, on the front side of the	<u>Top of Engine Components</u>	<u>Q17D Fuel Injector</u>

			engine		
Q27A	Pressure Control Solenoid Valve 1	MNG	In the engine compartment, part of the control solenoid valve assembly, mounted to the valve body inside the transmission	-	
Q27B	Pressure Control Solenoid Valve 2	MNG	In the engine compartment, part of the control solenoid valve assembly, mounted to the valve body inside the transmission	-	
Q27C	Pressure Control Solenoid Valve 3	MNG	In the engine compartment, part of the control solenoid valve assembly, mounted to the valve body inside the transmission	-	
Q32A	Shift Solenoid Valve 1	MNG	In the engine compartment, part of the control solenoid valve assembly, mounted to the valve body inside	-	

			the transmission		
Q38	Throttle Body	M4M	In the engine compartment, on the top of the engine	<u>Rear of Engine Components</u>	<u>Q38 Thro (M4M)</u>

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Signal	1	P0564	B3794 08, P0567, P0568	B3794 61, P0564
1. Cruise Control Malfunction				

Circuit/System Description

The cruise control switch is an input to the body control module (BCM). The BCM monitors the cruise control on/off, set/coast, resume/accelerate and cancel switches via the cruise control switch signal circuit in order to detect when the driver has requested to perform a cruise control function. The BCM detects a specific voltage signal on the cruise control switch signal circuit when a switch is applied. The engine control module (ECM) receives the requested cruise control switch function from the BCM via a serial data message.

Conditions for Running the DTC

- The cruise switch is ON.
- The ignition is ON.

Conditions for Setting the DTC

B3794 08

The BCM detects an invalid voltage signal on the cruise control switch signal circuit for 1 second.

B3794 61

Stuck switch for either Resume/Accel or Set/Coast button for 60 seconds.

P0564, P0565, P0567, P0568, P056C

- The BCM detects an invalid voltage signal on the cruise control switch signal circuit for greater than 2 seconds and sends a serial data message to the ECM. The ECM sets these DTCs when the message is received.
- The ECM runs this diagnostic continuously.

P0580, P0581

- The ECM detects an invalid voltage signal on the cruise control switch signal circuit.
- The above condition is present for greater than 2 seconds.
- The ECM runs this diagnostic continuously.

P155A

The ECM is unable to determine the state of the cruise control switch.

P162C

The ECM is unable to determine the state of the vehicle speed limiting switch.

Actions Taken When the DTC Sets

B3794

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A, P162C

DTCs P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A and P162C are type C DTCs

Conditions for Clearing the DTC

B3794

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A, P162C

DTCs P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A and P162C are type C DTCs.

Description and Operation

Cruise Control Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool ECM Cruise Control Switch Status parameter changes between Off and On, Resume and Set when switching between each position on the cruise control switch.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

NOTE:

- **An open ignition circuit or fuse before the control module will cause communication DTCs or power mode mismatch DTCs to set against or in**

the control module. This failure mode will be diagnosed in the no communications diagnostic procedure or power mode mismatch.

- **This test assumes the ignition circuit has a driver that will open under a high current condition before the fuse opens.**
- **The driver can open under normal conditions such as battery run down protection or a retained accessory power mode.**

1. Ignition OFF, disconnect the harness connector at the S70L Steering Wheel Controls Switch-Left, ignition ON.
2. Verify a test lamp illuminates between the ignition circuit terminal 1 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for greater than 100 ohms between the ignition circuit and ground.
 - If 100 ohms or less, repair the short to ground on the circuit.
 - If greater than 100 ohms
 3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Verify the scan tool ECM Cruise Control Switch Status parameter is Off.
 - **If not Off**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If Off**
4. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ignition circuit terminal 1.
5. Verify the scan tool ECM Cruise Control parameter is Disabled.
 - **If not Error**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 9 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Error**
6. Test or replace the S70L Steering Wheel Controls Switch-Left.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for BCM replacement, programming and setup.

DTC P0572 OR P0573: BRAKE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0572

Brake Switch Circuit 1 Low Voltage

DTC P0573

Brake Switch Circuit 1 High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Stop Lamp Switch Signal	P0572	P0572	P0573	P0572, P0573

Circuit/System Description

The stop lamp switch signal circuit is a B+ input from the body control module (BCM) to the engine control module (ECM). The ECM monitors the stop lamp switch circuit to detect when the brake pedal has been applied. The BCM monitors the brake pedal position sensor to determine when the brake pedal is applied. When the brake pedal is applied, the BCM supplies B+ on the stop lamp switch signal circuit and also sends a serial data message to the ECM indicating that the brake pedal has been applied.

Conditions for Running the DTC

- The engine is running.
- Battery voltage is greater than 11.5 V.
- Brakes applied.

Conditions for Setting the DTC

P0572

This DTC will set when the ECM detects a short to ground or an open on the discrete brake signal circuit when the serial data message from the BCM indicates the brakes are applied. This diagnostic will run when the serial data message and the voltage signal on the brake switch signal circuit do not match for 8 out of 10 times, and the condition is present for greater than 2 seconds.

P0573

This DTC will set when the ECM detects a short to voltage on the discrete brake signal circuit when the serial data message from the BCM indicates the brakes are NOT applied. This diagnostic will run when the serial data message and the voltage signal on the brake switch signal circuit do not match for 8 out of 10 times, and the condition is present for greater than 2 seconds.

Actions Taken When the DTC Sets

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module, ignition ON.
2. Connect a test lamp between the signal circuit terminal 25 and ground.
3. Verify the test lamp turns ON and OFF when pressing and releasing the brake pedal.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If not infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
4. Replace the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0575: CRUISE CONTROL SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0575

Cruise Control Switch Signal Message Counter Incorrect

Circuit/System Description

When a cruise control function switch is activated, the body control module (BCM) detects a predetermined voltage. The BCM sends a serial data message to the engine control module (ECM) indicating the function that has been requested.

Conditions for Running the DTC

- The ignition is ON.
- The vehicle speed is greater than 40 km/h (25 MPH) and the cruise control is engaged.

Conditions for Setting the DTC

- The ECM receives an invalid cruise control switch status serial data message from the BCM.
- This diagnostic runs continuously.

Actions Taken When the DTC Sets

DTC P0575 is a type C DTC.

Conditions for Clearing the DTC

DTC P0575 is a type C DTC.

Circuit/System Verification

1. Ignition ON.
2. Verify that no DTCs are set, except DTC P0575.
 - **If any other DTC is set, except DTC P0575**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If only DTC P0575 is set**
3. Replace the K9 Body Control Module.
 4. Verify DTC P0575 does not set when operating the vehicle within the Conditions for Running the DTC.
 - **If the DTC sets**

Replace the K20 Engine Control Module.

- **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0703: BRAKE SWITCH SIGNAL MESSAGE COUNTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0703

Brake Switch Signal Message Counter Incorrect

Circuit/System Description

The body control module (BCM) monitors the brake pedal position sensor. When the brake pedal is applied, the BCM detects a predetermined voltage signal. The BCM sends a serial data message to the engine control

module (ECM) indicating the status of the stop lamps.

Conditions for Running the DTC

The engine is ON.

Conditions for Setting the DTC

- The ECM receives an invalid brake pedal status serial data message from the BCM.
- This diagnostic runs continuously.

Actions Taken When the DTC Sets

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

SYMPTOMS - CRUISE CONTROL

NOTE: **The following steps must be completed before using the symptom tables.**

1. Before using the symptom diagnostic table, perform the **Diagnostic System Check - Vehicle** in order to verify the following conditions:
 - There are no DTCs set.
 - The module can communicate via the serial data.
2. Review the system operation in order to understand the system functions. Refer to **Cruise Control Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the Cruise Control System. Refer to **Checking Aftermarket Accessories** .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for**

Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
- **Cruise Control Indicator Malfunction**

CRUISE CONTROL INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster illuminates the cruise control engaged indicator based on serial data messages received from the engine control module (ECM). The indicator is commanded ON when the cruise control system is controlling vehicle speed, and turned OFF with the system disengaged.

DESCRIPTION AND OPERATION

CRUISE CONTROL DESCRIPTION AND OPERATION

Cruise Control System Block Diagram

Fig. 2: Identifying Cruise Control System Block Diagram
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
HW	Hard-Wired
HW	Hard-Wired
DD	Serial Data - GMLAN High Speed
K20	K20 Engine Control Module
S70L	S70L Steering Wheel Controls Switch - Left
P16	P16 Instrument Cluster
K9	K9 Body Control Module

Cruise control is a speed control system that maintains a desired vehicle speed under normal driving conditions at speeds above 40 km/h (25 mph). Steep grades may cause variations in the selected vehicle speeds.

The following are the main components of the Cruise Control System:

- The accelerator pedal
- The brake pedal position (BPP) sensor
- The body control module (BCM)
- The cruise on/off switch
- The cruise control cancel switch
- The + RES switch (equivalent to resume/accel switch)

- The - SET switch (equivalent to set/coast switch)
- The engine control module (ECM)
- The throttle actuator control (TAC) motor (gasoline engines only)
- The vehicle speed sensor

The body control module (BCM) monitors the signal circuit of the cruise control switches, which are located on the steering wheel. The BCM relays the cruise control switch status to the engine control module (ECM) via the serial data circuit. The ECM uses the status of the cruise control switch to determine when to capture and maintain the vehicle speed. The ECM monitors the vehicle speed signal circuit in order to determine the desired vehicle speed.

Voltage is supplied to the cruise control switch via the steering wheel control switch reference voltage circuit supplied by the BCM. The cruise control function switches are arranged in a resistive ladder design, with each cruise control function switch having a different resistance value. The BCM detects a specific voltage value that is associated with the cruise control function switch being activated. The BCM sends a serial data message to the ECM indicating that the on/off switch is active. Similarly, when the normally open + RES switch or the normally open - SET switch are pressed, the switch closes and the BCM detects the predetermined voltage signal on the cruise control resume/accel and set/coast switch signal circuit. The BCM sends a serial data message to the ECM indicating that the + RES switch or the - SET switch is active.

Cruise Control Engaged

The Cruise Control System will engage and adjust vehicle speeds, based on the activation of the following cruise control switches, which are located on the steering wheel:

- On/Off
- + RES
- - SET

To engage the Cruise Control System, ensure that the vehicle speed is above 40.2 km/h (25 mph), turn the cruise On/Off switch ON and momentarily press the - SET switch. The ECM will engage the Cruise Control System and record the vehicle speed. The ECM sends a serial data message to the instrument panel cluster (IPC) in order to illuminate the Cruise Engaged indicator in the IPC. Refer to the vehicle owner's manual for the location and operation of the cruise control On/Off indicators and driver information center (DIC) messages.

Pressing the accelerator pedal while the Cruise Control System is engaged, allows the driver to override the Cruise Control System in order to accelerate the vehicle beyond the current set vehicle speed. When the accelerator pedal is released, the vehicle will decelerate and resume the current set vehicle speed.

The driver can also override the current set vehicle speed via the - SET switch and the + RES switch. When the Cruise Control System is engaged, pressing and holding the - SET switch will allow the vehicle to decelerate from the current set vehicle speed without deactivating the Cruise Control System. When the - SET switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed. When the Cruise Control System is engaged, momentarily pressing the - SET switch will allow the vehicle to decelerate at a vehicle specific calibratable increment, commonly 1.6 km/h (1 mph), each time that the - SET is momentarily pressed, with a minimum vehicle speed of 38 km/h (24 mph). Refer to the vehicle Owner's Manual

for more information.

Pressing and holding the + RES switch, when the Cruise Control System is engaged, will allow the vehicle to accelerate to a greater vehicle speed than the current set vehicle speed. When the + RES switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed. When the Cruise Control System is engaged, momentarily pressing the + RES switch will allow the vehicle to accelerate at a vehicle specific calibratable increment, commonly 1.6 km/h (1 mph), each time that the + RES switch is momentarily pressed. Momentarily activating the + RES switch will recall the previous vehicle speed, after the cruise control system has been disengaged by pressing the brake pedal, or CANCEL switch. Refer to the vehicle Owner's Manual for more information.

Cruise Control Disengaged

The engine control module (ECM) disengages the cruise control operation based on the signals from the following switches:

- The brake pedal position (BPP) sensor
- The On/Off switch
- The cruise control cancel switch

The Cruise Control System will disengage when the brake pedal is applied. The body control module (BCM) monitors the BPP sensor via the BPP sensor signal circuit as the voltage signal increases while the pedal is further applied. The ECM monitors the BPP signal through a discrete input and a serial data message signal from the BCM indicating the brake status. When either signal indicates the brake pedal is applied, the ECM will disengage the cruise control system.

The Cruise Control System will also disengage when the cruise control on/off switch is switched OFF, or the cruise control cancel switch is activated. The body control module (BCM) determines when the cruise control cancel switch is activated. When the normally open cancel switch is closed, the BCM detects the predetermined voltage signal on the cruise control function switch circuit. The vehicle speed stored in the memory of the engine control module will be erased when the cruise control On/Off switch is turned OFF, or the ignition switch is turned OFF. The BCM sends a serial data message to the ECM in order to disengage the cruise control system. When the Cruise Control System has been disengaged, the ECM sends a serial message to the instrument panel cluster (IPC) in order to turn OFF the Cruise Engaged indicator.

Every time the Cruise Control System is disengaged, the ECM will keep track of the reason for system disengagement. The last 8 disengagement reasons will be recorded within the ECM memory. The scan tool will display the last 8 Cruise Disengage History parameters, in which one out of approximately 50 possible reasons will be displayed in each of these 8 parameters. For the disengagement reason to be displayed within the scan tool parameter the Cruise Control System is active and disengagement is requested.

When engagement of the system is requested but an engagement inhibit is present, the most recent inhibit reason is recorded in the ECM history. The scan tool will display the most recent inhibit reason, in which one out of approximately 50 possible reasons will be displayed.

Cruise Control Inhibited

The engine control module (ECM) inhibits the cruise control operation when any of the following conditions exist:

- The ECM has not detected a brake pedal activation from the body control module (BCM) this ignition cycle.
- A Cruise Control System DTC has been set.
- The vehicle speed is less than 38.6 km/h (24 mph).
- The vehicle speed is too high.
- The vehicle is in PARK, REVERSE, NEUTRAL, or 1st gear.
- The engine RPM is low.
- The engine RPM is high.
- The system voltage is not between 9 volts and 16 volts.
- The Antilock Brake System (ABS)/Traction Control System (TCS) is active for more than a calibratable time (typically 0.3 to 0.7 seconds).

Cruise Control Inhibit Reasons

This is a general list of inhibit reasons. Not every inhibit reason is applicable to all vehicles. Refer to the scan tool inhibit reason list for the last 8 reasons that have been recorded during the current ignition cycle.

Scan Tool Name	Description	Long Description
ACC BRAKE INOP	Adaptive Cruise Control Automatic Braking Failed	Adaptive Cruise Control Automatic Braking Inoperative
ACC DATA	Serial data fault for Adaptive Cruise Control Throttle Control and Brake Control signals sent by Adaptive Cruise Control module	Adaptive Cruise Control Module serial data fault is active or communication has been lost between ACC module and ECM.
ACC INHIBIT	Adaptive Cruise Control Inhibited	Adaptive Cruise Control Inhibited
ACC OPTION	Adaptive Cruise Control option mismatch	Cruise control type (adaptive cruise or conventional cruise) mismatched between ECM and BCM.
ACCEL RATE	High acceleration	Vehicle acceleration rate is too high.
Accel Time	Rate Limiting Fault	Cruise torque request rate limiting active too long
APP OVERRIDE	Pedal greater than cruise (override)	Driver has overridden cruise control set speed with accelerator pedal for greater than an allowable time.
Auto Brk Data	Automatic Braking Engine Torque Request Signal Communication Malfunction	ECM to EBCM serial data fault is active or communication has been lost between ECM and EBCM.
AXLE RANGE	Rear Axle Low	Rear axle in low range
BPP DATA	DTC P0703 active or maximum time elapsed without receiving valid Brake Pedal Position signal.	Serial data fault is active or communication has been lost with module sending brake pedal apply state

BPP DTC	Brake Pedal Position signal invalid	Brake Pedal Apply Circuit fault has been detected.
BPP Not Learned	Brake Apply Sensor Home Position Not Learned	Brake Pedal Position Sensor Released Position Not Learned.
BRAKE	Brake pedal apply	Brake Pedal was applied.
Brk Ped Press	Brake Pedal Driver Applied Pressure Detected	A Brake Pedal Apply has been detected based on brake pedal pressure as measured by the EBCM.
Calc Eng Torque	Calculated Torque	Engine torque calculation is incorrect.
CANCEL	Cancel switch active	Cancel Switch was depressed.
CLUTCH	Clutch switch active	Clutch Pedal was applied.
COAST DISENGAGE	Coast disengage	Cruise control is in coast mode with the Set/Coast switch depressed and is requesting no throttle
COAST SPEED LOW	Coast below low speed inhibit	Set / Coast switch was depressed. Vehicle slowed below minimum cruise operating speed.
Cruise Brk Inop	Brake System Malfunction	EBCM has detected a failure that does not allow automatic braking to be performed.
CRUISE S/W	Sequence of completion checks	Cruise control software execution error has occurred.
CRUISE SW DATA	Serial data fault (Cruise switch serial communication fault)	Cruise switch serial data fault is active or communication has been lost with module sending cruise switch states
CRUISE SW. OFF	On/Off switch in Off state	Cruise On/Off switch turned Off
DECEL RATE	High deceleration	Vehicle deceleration rate is too high.
DLC OVERRIDE	ALDL	Scan Tool plugged into ALDL connector
DTC SET	Malfunction in PCM/ECM (DTC active)	DTC is active or in history that inhibits cruise control operation.
D WHL SPD HI	Driven Whl Spd Greater (wheel slip detection)	Driven wheel speed greater than Non Driven wheel speed (slip detection)
D WHL SPD LOW	Un-driven Whl speed Greater	Non Driven wheel speed greater than driven wheel speed
ECM INHIBIT	PCM/ECM inhibit (RAM corruption)	ECM internal communication error
ECM RESET	ECM Running Reset	ECM Running Reset occurred
ECT OVERTEMP	Engine metal overtemp active	Engine over temperature. Overheated.
ENG RUN TIME	Engine run time not elapsed	Engine has not been running long enough, typically five seconds.
ENGINE SPEED	Engine speed too low or too high	Engine RPM too low (near stall) or too high (near engine RPM fuel shutoff).
FIRST GEAR	1st Gear	Transmission is engaged in 1st gear

HIGH SPEED	Vehicle speed exceeds high speed threshold	Vehicle speed has exceeded maximum cruise operating speed
HIGH VOLTAGE	Voltage above high voltage threshold	Ignition Voltage High at ECM (typically 18 volts)
ILLEGAL MODE	Illegal cruise mode	Cruise control mode is incorrect based on switch states.
LOST FWD GEAR	Transmission in neutral. Reverse or park	Gear selector not in forward gear
LOW SPEED	Vehicle speed drops below low speed threshold	Vehicle speed dropped below the cruise control minimum operating speed. May be due to hilly terrain and low vehicle speed. Manual transmission gear selection and engine torque may contribute to this disengagement reason.
LOW VOLTAGE	Voltage below low voltage threshold	Ignition Voltage Low at ECM (typically 9 volts)
MEMORY DTC	Memory Failure	Control module memory failure detected.
MPH LIMIT	MPH Limited Fuel (Vehicle overspeed fuel cut-off active)	Vehicle overspeed protection active with fuel cut off active
M/T Gear Changed	Manual transmission out of gear with no clutch pedal apply	Manual transmission shifted to Neutral without clutch pedal being applied.
NONE	None	This disengagement reason may be displayed after a dead battery repair or module replacement.
OVER SET SPEED	Over schedule	Vehicle speed has exceeded driver selected set speed by more than an allowable amount. This may occur while driving down a significant grade or driver overriding cruise while performing a passing maneuver.
PARK BRAKE	Park Brake Switch signal Active	Parking Brake Applied
PEDAL INITIALIZE	Brake before cruise	The brake pedal has not been seen as applied prior to driver request to engage cruise with set switch. A brake pedal apply must be seen before allowing cruise engagement during each key cycle. On a vehicle equipped with a manual transmission, a clutch pedal apply may satisfy the brake pedal apply criteria.
PTO ACTIVE	Power Take Off Active	Power Take Off is active.
Ram DTC	Processor Integrity Fault (Ram corruption)	ECM software error has occurred

RPM LIMIT	Injectors Disabled (Engine overspeed fuel cut-off active)	Engine RPM limiter active with fuel cut off active.
S/C ON SPEED HI	Over schedule tap-down	Set/Coast switch selected, vehicle speed is above set speed and does not decrease. May be due to traveling down hill
SIMUL S/C-R/A	SET and RESUME switches simultaneously active	Set/Coast and Resume Accelerate switches pressed simultaneously
SL/W Sys On	Speed Limiter / Warning On/Off switch turned on	Driver has turned on the Speed Limiter/Warning on/off switch. Cruise is disabled / inhibited and cruise on/off switch will be set to OFF.
SW. INVALID	Analog cruise switch input out of range	Cruise switch voltage signal in invalid range
TAC INHIBIT	ETC prevents cruise operation	Electronic Throttle Control has detected a failure in the throttle control hardware
TCS	Traction control active	Traction Control was Active
TRANS DTC	Trans Gear Fault	Transmission DTC is active or in history that inhibits cruise control operation
UNDER SET SPEED	Under schedule	Vehicle speed is below cruise control set speed by more than an allowable amount
VSES	Vehicle stability active	Vehicle Stability Control was active
4WD Low	4WD Low	Transfer case in low range

DTC B1000: ELECTRONIC CONTROL UNIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1000

Electronic Control Unit

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The internal fault detection is handled inside the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.
- If this DTC is retrieved as both a current and history DTC, replace the device that set the DTC.

Reference Information

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B1000 is not set.
 - **If DTC B1000 is set**

Replace the device that set the DTC.

- **If DTC B1000 is not set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for device replacement, programming and setup

DTC B1001: OPTION CONFIGURATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1001

Option Configuration

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Some devices must be configured with serial numbers, vehicle options, or other information. If a device was not properly configured after installation that device may set DTC B1001. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9-16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B1001 is not set.
 - **If DTC B1001 is set**
 1. Program the device that set the DTC.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the device that set the DTC.
 - If the DTC does not set
 - **If DTC B1001 is not set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B101D: ELECTRONIC CONTROL UNIT HARDWARE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B101D

Electronic Control Unit Hardware

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The internal fault detection is handled inside the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

- The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.
- The keyless entry control module will set this DTC with symptom byte 39 when the keyless entry control module antenna is activated.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- Do not replace a device based only on DTC B101D being set in history with the exception of the following devices:
 - K36 Inflatable Restraint Sensing and Diagnostic Module (SDM)
 - K85 Passenger Presence Detection Module
- If DTC B101D is set as current, replace the appropriate device.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B101D is not set.
 - **If DTC B101D is set with symptom byte 43**
 1. Program the device that set the DTC.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the device that set the DTC.
 - If the DTC does not set
 - 3. All OK.
 - **If DTC B101D is set with any symptom byte, except symptom byte 43**

Replace the device that set the DTC.
 - **If DTC B101D is not set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for device replacement, programming and setup

DTC B101E: ELECTRONIC CONTROL UNIT SOFTWARE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B101E

Electronic Control Unit Software

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Some devices must be configured with specific software, serial numbers, vehicle options, or other information. If a device was not properly configured after installation that module may set DTC B101E. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9-16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

DTC C056D: ELECTRONIC CONTROL UNIT HARDWARE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C056D

Electronic Control Unit Hardware

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The internal fault detection is handled inside the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.
- If this DTC is retrieved as both a current and history DTC, replace the device that set the DTC.

DTC C056E: ELECTRONIC CONTROL UNIT SOFTWARE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C056E

Electronic Control Unit Software

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Some devices must be configured with specific software, serial numbers, vehicle options, or other information. If a device was not properly configured after installation that module may set DTC C056E. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9-16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the device. This diagnostic also addresses if the device is not programmed. The device monitors its ability to read and write to the memory. It also monitors a timing function. No external circuits are involved.

Conditions for Running the DTC

- The ignition is ON.
- The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The device detects an internal malfunction or incomplete programming.

Action Taken When the DTC Sets

DTCs P0601-P0606, P060A, P062F, and P262B are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0601-P0606, P060A, P062F, and P262B are Type A DTCs.

Diagnostic Aids

If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.

DTC U0001: HIGH SPEED CAN COMMUNICATION BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U0001 00

High Speed CAN Communication Bus Malfunction

Circuit Description

Devices connected to the GMLAN serial data circuits monitor for serial data communications on the GMLAN network during normal vehicle operation. Operating information and commands are exchanged among the devices. Each device on GMLAN network maintains a transmit error counter and a receive error counter. The counter values increase with detected errors and will decrease with error-free messages. If the transmit error counter value exceeds 255 the device removes itself from the network and a DTC U0001 will be set.

Conditions for Running the DTC

- System voltage is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.

Conditions for Setting the DTC

A certain number of no valid transmitted messages on the GMLAN serial data circuits are detected by the device.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the GMLAN serial data circuits.

- The device inhibits the setting of all other GMLAN communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

This DTC may not be retrieved with a current status. Diagnosis is accomplished via the symptom, Scan Tool Does Not Communicate with High Speed GMLAN Device. Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** in order to isolate an intermittent condition caused by a short on the GMLAN serial data circuits.

DTC U0020: LOW SPEED CAN BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC U0020

Low Speed CAN Bus

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Devices connected to the GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have programmed information about what messages are needed to be exchanged on the serial data circuits. The messages are also supervised and some periodic messages are used by the receiver device as an availability indication of the transmitter device.

Conditions for Running the DTCs

- Supply voltage to the devices is in the normal operating range.
- The vehicle power mode requires serial data communication to occur.
- The DTC U2100 does not have a current status.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTCs Sets

The device uses a default value for the missing parameter.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

Diagnosis of this DTC is accomplished via the symptom or an additional DTC. Refer to **Scan Tool Does Not Communicate with Low Speed GMLAN Device**, or **Diagnostic Trouble Code (DTC) List - Vehicle** .

DTC U0073 OR U2100: CONTROL MODULE COMMUNICATION BUS A/CAN BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC U0073

Control Module Communication Bus A Off

DTC U2100

CAN Bus Communication

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The serial data circuits are used to communicate information between the devices. The serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTCs

- Supply voltage to the devices is in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the serial data circuits more than 3 times in 5 s.

Action Taken When the DTCs Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- In the transmission control module, DTC U0073 will cause the transmission to go into default gears.
- In the engine control module and transmission control module, DTC U0073 will cause the malfunction indicator lamp (MIL) to illuminate.
- If equipped with eAssist, DTC U0073 in the hybrid powertrain control module is a type B DTC and will cause the malfunction indicator lamp to illuminate and result in the engine operating in conventional engine mode and will maintain 14 V module operation.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- The engine control module or transmission control module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- If equipped with eAssist, the hybrid powertrain control module turns off the MIL after the diagnostic runs and does not fail during subsequent ignition cycles. Normal operation will resume 5 s after subsequent ignition cycle.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Refer to **Data Link References** to determine which serial data communication system is used for a specific device.
2. This DTC may not be retrieved with a current status. Diagnosis is accomplished using the symptom. Refer to **Symptoms - Data Communications**.

DTC U0074: CONTROL MODULE COMMUNICATION BUS B

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U0074

Control Module Communication Bus B Off

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Chassis High Speed GMLAN Serial Data (+)	U0074	U0074, U0100-U02FF*	U0074	-
Chassis High Speed GMLAN Serial Data (-)	U0074	U0074, U0100-U02FF*	U0074	-
Ground (DLC, terminal 5)	-	1	-	-
* An open between the data link connector (DLC) and the first splice/device will only affect the communication with the scan tool. The devices will still communicate. An open in only one chassis high speed GMLAN serial data circuit may allow degraded communication between the devices. 1. No communication with any chassis high speed GMLAN device.				

Circuit/System Description

The devices connected to the chassis high speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices when the ignition switch is in any position other than OFF. The chassis high speed GMLAN serial data bus uses terminating resistors that are in parallel with the chassis high speed GMLAN (+) and (-) circuits.

Conditions for Running the DTC

The system voltage is between 9-16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the **Data Link References** to identify the chassis high speed GMLAN devices.
- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A device on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more devices was interrupted during diagnosis.
 - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
 - If a loss-of-communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between some devices and the scan tool with the chassis high speed GMLAN serial data system inoperative. This condition is due to those devices using multiple serial data communication systems.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC).
- Some devices may not have internal protection for specific voltage outputs and may open a battery positive voltage or ignition voltage source fuse. If a voltage input fuse is open and no short is found in that circuit, ensure that no device output voltage circuit is shorted to ground before replacing the device.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify two or more devices are not communicating on the chassis high speed GMLAN serial data circuit. Refer to **Data Link References** to determine how many devices should be communicating on the bus.
 - **If only one device is not communicating**

Refer to Circuit/System Testing - Testing the Device Circuits.

- **If two or more devices are not communicating**
3. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the scan tool from the X84 Data Link Connector. The following tests will be done at the X84 Data Link Connector. It may take up to 2 minutes for all vehicle systems to power down.
 4. Test for less than 10 ohms between the ground circuit terminal 5 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
 5. Ignition ON.
 6. Test for less than 4.5 V between the serial data circuits listed below and ground:
 - Chassis high speed GMLAN serial data terminal 12
 - Chassis high speed GMLAN serial data terminal 13
 - **If 4.5 V or greater**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Voltage.

- **If less than 4.5 V**
7. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.

8. Test for greater than 100 ohms between the serial data circuits listed below and ground:

- Chassis high speed GMLAN serial data terminal 12
- Chassis high speed GMLAN serial data terminal 13
- **If 100 ohms or less**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Ground.

- **If greater than 100 ohms**

9. Test for 50-70 ohms between the serial data circuit terminals 12 and 13:

- **If less than 35 ohms**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If between 35-50 ohms**

There may be a third terminating resistor between the serial data circuits. This can happen if the incorrect device is installed. Some devices are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness. Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If greater than 70 ohms but less than infinite**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for an Open/High Resistance.

- **If infinite resistance**

Repair the open/high resistance in the circuit between the X84 Data Link Connector and the first splice/device in the serial data circuit.

- **If between 50-70 ohms**

10. Refer to Circuit/System Testing - Testing the Device Circuits.

Circuit/System Testing

NOTE: Each device may need to be disconnected to isolate a circuit fault.

Use the schematic to identify the following:

- Chassis high speed GMLAN devices the vehicle is equipped with
- Chassis high speed GMLAN serial data circuit terminating resistors
- Device locations on the chassis high speed GMLAN serial data circuits
- Each device's ground, B+, ignition, and chassis high speed GMLAN serial data circuit terminals

Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition OFF, disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device, ignition ON.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 4.5 V or less**
 1. Ignition OFF.
 2. Test for less than 10 ohms between each of the device's ground circuit terminals and ground.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms, replace the device that was disconnected.
 - **If any serial data circuit is greater than 4.5 V**
3. Ignition OFF, disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, ignition ON.
4. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 4.5 V or less**
 1. Ignition OFF.
 2. Test for less than 10 ohms between each of the device's ground circuit terminals and ground.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms, replace the device that was disconnected.
 - **If any serial data circuit is greater than 4.5 V**
5. Repeat step 3 until one of the following conditions are isolated:
 - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
 - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device.
3. Test for greater than 100 ohms between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 100 ohms or greater**

Replace the device that was disconnected.

- **If any serial data circuit is less than 100 ohms**

4. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
5. Test for greater than 100 ohms between each serial data circuit at the device connector that was just disconnected and ground.

- **If both serial data circuits are 100 ohms or greater**

Replace the device that was disconnected.

- **If any serial data circuit is less than 100 ohms**

6. Repeat step 4 until one of the following conditions are isolated:
 - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
 - A short to ground on the serial data circuit between a device and a terminating resistor.
 - A short to ground on the serial data circuit between the X84 Data Link Connector and the first device or splice pack.

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for greater than 110 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 110 ohms or greater**

Replace the device that was disconnected.

- **If any pair of serial data circuits is less than 110 ohms**

4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
6. Test for greater than 110 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 110 ohms or greater**

Replace the device that was disconnected.

- **If any pair of serial data circuits is less than 110 ohms**

7. Repeat step 4 until one of the following conditions are isolated:
 - Serial data circuits shorted together between two devices or splice packs, if equipped.

- Serial data circuits shorted together between a device and a terminating resistor.
- Serial data circuits shorted together between the X84 Data Link Connector and the first device or splice pack.
- A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for less than 130 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 130 ohms or less**

Replace the device that was disconnected.

- **If any pair of serial data circuits is greater than 130 ohms**

4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
6. Test for less than 130 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 130 ohms or less**

Replace the device that was disconnected.

- **If any pair of serial data circuits is greater than 130 ohms**

7. Repeat step 4 until one of the following conditions are isolated:
 - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
 - An open/high resistance on the serial data circuit between a device and a terminating resistor.
 - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors at an easily accessible device that is not communicating.
3. Test for less than 10 ohms between each ground circuit terminal and ground.

- **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 10 ohms**
- 4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected device.
 - **If the test lamp illuminates**
- 5. Ignition ON.
- 6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected device.
 - **If the test lamp illuminates**
- 7. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connectors at the control module that controls the ignition circuit.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the ignition circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the control module that controls the ignition circuit.

- **If the test lamp illuminates**

8. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
9. Test for less than 130 ohms between each pair of chassis high speed GMLAN serial data circuits at the device connector that was just disconnected.
 - **If any pair of serial data circuits is greater than 130 ohms**

Repair the open/high resistance in the serial data circuits between the disconnected device and the circuit splice in the serial data circuits.

- **If each pair of serial data circuits is 130 ohms or less**

10. Replace the device that was disconnected.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **GMLAN and Media Oriented Systems Transport (MOST) Wiring Repairs**

DTC U0078: CONTROL MODULE COMMUNICATION LOW SPEED CAN BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U0078

Control Module Communication Low Speed CAN Bus Off

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The low speed GMLAN serial data bus is used to communicate information between the devices. The serial data is transmitted over a single wire to the appropriate devices. The low speed GMLAN serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTC

- Supply voltage to the devices are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the serial data circuits more than 3 times in 5 s.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC U0078 is not set.
 - If DTC U0078 is set

Refer to Scan Tool Does Not Communicate with Low Speed GMLAN Device.

- If DTC U0078 is not set
3. All OK

DTC U0100-U02FF: MODULE ERROR

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

For device DTC descriptors, refer to Control Module U Code List.

Diagnostic Fault Information

1. Scan tool does not communicate with most low speed GMLAN device 2. Scan tool does not communicate with most high speed GMLAN device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the Data Link Connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for Diagnostic Trouble Codes (DTC). When the ignition switch is in RUN, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non-communicating device. The DTC is unique to the device which is not communicating and one or more devices may set the same exact code. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9-16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- Specific subsystems will not function.
- DTC U0100 in the Transmission Control Module will cause the transmission to go into default gears.
- Both DTC U0100 in the Transmission Control Module and DTC U0101 in the Engine Control Module will cause the malfunction indicator lamp (MIL) to illuminate.

Conditions for Clearing the DTC

- The Engine Control Module or Transmission Control Module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A device on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more devices was interrupted during diagnosis.
 - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
 - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between some devices and the scan tool with either the low or high speed GMLAN serial data system inoperative. This condition is due to those devices using multiple serial data communication systems.
- Use **Data Link References** to determine what serial data communications the device uses.

- Some devices may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the device.
- Some intermittent communication concerns may be caused by fretting corrosion on the serial data circuit terminals. Inspect all connectors at the device that set the communication DTC, the device that the communication DTC was set against, and any inline harness connectors between the two devices. Do not replace a device based only on fretting corrosion. Refer to bulletin 09-06-03-004 for assistance with the diagnosis and repair of this condition, if applicable.
- This diagnostic can be used for any device that is not communicating, regardless of the type of serial data circuit it is connected to, providing the vehicle is equipped with the device.

Circuit/System Verification

1. Determine the device that is not communicating. Refer to **Control Module U Code List**.
2. Verify that DTC U0073, U2100, U0074, U0078, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**
- 3. Verify that DTC U0125 and DTC U0126 are not set together.
- **If both of the DTCs are set together**

Refer to **Scan Tool Does Not Communicate with Chassis High Speed GMLAN Device.**

- **If both of the DTCs are not set together**
- 4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wakeup serial data, serial data communication enable, and serial data circuit terminals.

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect all the harness connectors at the device that is not communicating.
2. Test for less than 10 ohms between each ground circuit terminal and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected device.
 - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected device.
 - **If the test lamp illuminates**
 6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connectors at the control module that controls the ignition circuit.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the control module that controls the ignition circuit.
 - **If the test lamp illuminates**
 7. Test for less than 4.5 V between each GMLAN serial data circuit terminal and ground.
 - **If 4.5 V or greater between a low speed GMLAN serial data circuit and ground**
- Refer to **Scan Tool Does Not Communicate with Low Speed GMLAN Device** to test for a short to voltage.
- **If 4.5 V or greater between a high speed GMLAN serial data circuit and ground**
- Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** to test for a short to voltage.
- **If less than 4.5 V**
8. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
 9. Test for greater than 100 ohms between each GMLAN serial data circuit terminal and ground.
 - **If 100 ohms or less between a low speed GMLAN serial data circuit and ground**

Refer to **Scan Tool Does Not Communicate with Low Speed GMLAN Device** to test for a short to ground.

- **If 100 ohms or less between a high speed GMLAN serial data circuit and ground**

Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** to test for a short to ground.

- **If greater than 100 ohms**

10. Test for less than 2 ohms in each of the GMLAN serial data circuits end to end between the device harness connector and the X84 Data Link Connector terminals listed below.

- Low speed GMLAN serial data circuit terminal 1
- High speed GMLAN serial data circuit terminal 6 or 14
- Mid speed GMLAN serial data circuit terminal 3 or 11
- Chassis high speed GMLAN serial data circuit terminal 12 or 13
- Object high speed GMLAN serial data circuit terminal 3 or 11

- **If 2 ohms or greater**

Repair the open/high resistance in the serial data circuit between the non communicating device and the device setting the DTC or a serial data splice pack.

- **If less than 2 ohms**

NOTE: **The following test step is only applicable to a high speed GMLAN device with 2 pairs of serial data circuits or a high speed GMLAN device with an internal terminating resistor.**

11. Test for 110-130 ohms between each pair of high speed GMLAN serial data circuits.

- **If less than 110 ohms**

Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** to test for a short to ground or a short between the serial data circuits.

- **If greater than 130 ohms**

Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** to test for an open/high resistance in the serial data circuit.

- **If between 110-130 ohms**

12. Replace the device that is not communicating.

DTC Descriptor

Refer to **Control Module U Code List**.

Circuit/System Description

Some devices must be configured with specific software, serial numbers, vehicle options, or other information. If a device was not properly configured after installation that device may set the appropriate communication DTCs. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9-16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

Refer to **Control Module U Code List**.

Circuit/System Description

Some devices are constantly receiving information from other devices through serial data communication network. The invalid data code will be set when a receiving device detects a discrepancy in information it receives from another device causing its integrity to be questioned. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9-16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1500-U15BF	U1500-U15BF	-	-
Ignition	U1500-U15BF	U1500-U15BF	-	-
LIN Serial Data	U1500-U15BF	U1500-U15BF	U1500-U15BF	-
Ground	-	U1500-U15BF	-	-

Circuit/System Description

The serial data is transmitted over a Local Interconnect Network (LIN) single wire network circuit bus between a master control module and other LIN devices within a particular subsystem. If serial data communication is lost between any of the LIN devices on the LIN bus network, a no communication code against the non-communicating LIN device will be set. A master control module is the one that reports the non communication code.

Conditions for Running the DTC

The system voltage is between 9-16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A device on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more devices was interrupted during diagnosis.
 - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
 - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for

a communication issue.

- Communication will be available between the master control module and the scan tool if there is a loss of communications with any of the other LIN devices on the LIN bus network.
- Some devices may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the device.
- Some intermittent communication concerns may be caused by fretting corrosion on the serial data circuit terminals. Inspect all connectors at the device that set the communication DTC, the device that the communication DTC was set against, and any inline harness connectors between the two devices. Do not replace a device based only on fretting corrosion. Refer to bulletin 09-06-03-004 for assistance with the diagnosis and repair of this condition, if applicable.
- An open in the LIN bus serial data circuit between the splice pack and a LIN device will only affect that specific LIN device. This type of failure will set a loss of communication DTC for each LIN device affected and the other LIN devices will still communicate.

Circuit/System Verification

1. Determine the LIN device that is not communicating. Refer to **Control Module U Code List**.
2. Verify that DTC B1325, B1330, B1370, B1380, B1424, B1440, B1441, B1517, C0800, C0899, C12E1,

P0560, or P0562 is not set.

- **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

3. Verify that DTC U0100-U02FF is not set.

- **If any of the DTCs are set**

Refer to **DTC U0100-U02FF**.

- **If none of the DTCs are set**

4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE:

- **For some vehicles, both headlamps may be connected to the same LIN circuit through a splice. Or both LIN circuits to the headlamps may be internally connected at the connector of the K26 Headlamp Control Module or K28 Headlamp Leveling Control Module. A short in one headlamp or its LIN circuit may cause no communication to both headlamps. Ensure to diagnose both LIN circuits and headlamps prior to replacing a headlamp.**
- **Use the schematic to identify the following:**
 - **The master control module and the LIN devices on the same LIN serial data circuit**
 - **The master control module's LIN serial data circuit terminal and the LIN device's B+, ignition, ground, and LIN serial data circuit terminals**

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connector at a LIN device that is not communicating. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between each ground circuit terminal and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between each B+ circuit terminal and ground, if equipped.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.

2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected LIN device.
 - **If the test lamp illuminates**
5. Ignition ON.
6. Verify a test lamp illuminates between each ignition circuit terminal and ground, if equipped.
 - **If the test lamp does not illuminate and the circuit fuse is good**
1. Ignition OFF.
2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
1. Ignition OFF.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected LIN device.
 - **If the test lamp illuminates**
7. Ignition ON.
8. Verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground, if equipped.
 - **If the test lamp does not illuminate**
1. Ignition OFF, disconnect the harness connectors at the control module that controls the ignition circuit.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the control module that controls the ignition circuit.
 - **If the test lamp illuminates**
9. Ignition ON.

NOTE: For accurate voltage reading, disconnect the battery charger prior to

performing the following test step.

10. Test for 2-13 V between the LIN serial data circuit terminal and ground.
 - **If less than 2 V**
 1. Ignition OFF, disconnect the harness connector at the control module setting the DTC and all LIN devices that share the same LIN serial data circuit.
 2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the serial data circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms
 4. Reconnect the control module that set the DTC, ignition ON.
 5. Test for 2-13 V between the LIN serial data circuit terminal and ground.
 - If less than 2 V, replace the control module setting the DTC.
 - If greater than 2 V, replace the LIN device that causes a current DTC to set when connected.
 - **If greater than 13 V**
 1. Ignition OFF, disconnect the harness connector at the control module setting the DTC and all LIN devices that share the same LIN serial data circuit.
 2. Ignition ON.
 3. Test for less than 1 V between the serial data circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 4. Ignition OFF, reconnect the control module that set the DTC, ignition ON.
 5. Test for 2-13 V between the LIN serial data circuit terminal and ground.
 - If greater than 13 V, replace the control module setting the DTC.
 - If less than 13 V, replace the LIN device that causes a current DTC to set when connected.
 - **If between 2-13 V**
11. Replace the disconnected LIN device.

DTC U1814: POWERTRAIN WAKE-UP COMMUNICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U1814

Powertrain Wake-Up Communication Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	U1814 02*	U0100-U02FF	-	-
* Vehicle may not start.				

Circuit/System Description

The body control module (BCM) activates the ignition circuit, when the ignition key is in ACC, ON or START. The ignition circuit wakes up the devices for serial data bus communication.

Conditions for Running the DTC

- The system voltage is between 9-16 V.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The BCM senses a short to ground on the ignition circuit.

Action Taken When the DTC Sets

- The output command is turned off while the malfunction is present.
- The devices use a default value for the missing parameters until the next ignition cycle.
- The device(s) is never signaled. Therefore, the specific subsystem(s) will not function.
- The vehicle will not start while the circuit is shorted to ground.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

NOTE: Use the schematic to determine which devices are on the K9 Body Control Module's ignition circuit terminal 22 X4. Use the connector end view to identify the ignition circuit terminal for each of those devices.

1. Ignition OFF, disconnect the harness connectors at an easily accessible device that shares the K9 Body Control Module's ignition circuit terminal 22 X4. Ignition ON.
2. Verify that the DTC U1814 remains current.

- **If the DTC becomes history**

Replace the device that was just disconnected.

- **If the DTC remains current**

3. With the prior devices disconnected, repeat steps 1 and 2 for each device on the ignition circuit except the K9 Body Control Module.
4. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
5. Test for infinite resistance between the ignition circuit terminal 22 X4 at the K9 Body Control Module and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

6. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **GMLAN and Media Oriented Systems Transport (MOST) Wiring Repairs**

DTC U18B9-U18BF: HIGH SPEED CAN BUS SUBNET CONFIGURATION LIST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U18B9

Primary High Speed CAN Bus Subnet Configuration List

DTC U18BF

Secondary High Speed CAN Bus Subnet Configuration List

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Devices on the high speed GMLAN serial data bus and the chassis high speed GMLAN serial data bus must be programmed with software that specifically identifies the correct type and quantity of devices on the bus based on RPO configuration. If a device was not properly configured after installation, the appropriate U Code may be set for that device. No external circuit diagnosis is involved.

Conditions for Running the DTC

- Voltage supplied to the device is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.

Conditions for Setting the DTC

- The device is not configured properly.
- Control unit recognises a programming error.
- CAN-Bus configuration is invalid

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC U18B9-U18BF is not set.
 - **If DTC U18B9-U18BF is set along with other DTCs set**

Diagnose all other DTCs first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If DTC U18B9-U18BF is set without other DTCs set**

1. Program the device that set the DTC.
2. Ignition OFF, remove the scan tool, open and close the driver door. Wait 60 s.
3. Verify the DTC does not set.
 - If the DTC sets, replace the appropriate device.
 - If the DTC does not set

4. All OK.

- **If DTC U18B9-U18BF is not set**

3. All OK

DTC U2099: HIGH SPEED COMMUNICATION ENABLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U2099

High Speed Communication Enable Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	U2099*	U0100-U02FF	U0100-U02FF	-
* Vehicle may not start.				

Circuit/System Description

The body control module (BCM) activates the ignition circuit, when the ignition key is in ACC, ON or START. The ignition circuit wakes up the devices for serial data bus communication.

Conditions for Running the DTC

- The system voltage is between 9-16 V.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The BCM senses a short to ground on the ignition circuit.

Action Taken When the DTC Sets

- The output command is turned off while the malfunction is present.
- The devices use a default value for the missing parameters until the next ignition cycle.
- The device(s) is never signaled. Therefore, the specific subsystem(s) will not function.
- The vehicle will not start while the circuit is shorted to ground.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

NOTE: Use the schematic to determine which devices are on the K9 Body Control Module's ignition circuit terminal 23 X4. Use the connector end view to identify the ignition circuit terminal for each of those devices.

1. Ignition OFF, disconnect the harness connectors at an easily accessible device that shares the K9 Body Control Module's ignition circuit terminal 23 X4. Ignition ON.
2. Verify that the DTC U2099 remains current.

- **If the DTC becomes history**

Replace the device that was just disconnected.

- **If the DTC remains current**

3. With the prior devices disconnected, repeat steps 1 and 2 for each device on the ignition circuit except the K9 Body Control Module.
4. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
5. Test for infinite resistance between the ignition circuit terminal 23 X4 at the K9 Body Control Module and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

6. Replace the K9 Body Control Module.

SYMPTOMS - DATA COMMUNICATIONS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no Diagnostic Trouble Codes (DTC) set.
 - The devices can communicate via the serial data links.

2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Data Link Communications Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Scan Tool Does Not Power Up**
- **Scan Tool Does Not Communicate with High Speed GMLAN Device**
- **Scan Tool Does Not Communicate with Low Speed GMLAN Device**

SCAN TOOL DOES NOT POWER UP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Data Link Connector B+	1	1	-	-
Data Link Connector Ground	-	1	-	-
1. Scan Tool Does Not Power Up				

Circuit/System Description

The data link connector (DLC) is a standardized 16 cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool B+ voltage at terminal 16

- Scan tool ground at terminal 4
- Common ground at terminal 5

Diagnostic Aids

- The scan tool will power up with the ignition OFF. Some devices however, will not communicate unless the ignition is ON and the power mode master device sends the appropriate power mode message.
- If the B+ circuit, ground circuits, and connections of the data link connector are functioning properly, the malfunction must be due to the scan tool.

Circuit/System Testing

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 2 ohms between each of the X84 Data Link Connector ground circuit terminals listed below and ground.
 - Ground circuit terminal 4
 - Ground circuit terminal 5
 - **If 2 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 2 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 16 at the X84 Data Link Connector and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - **If the test lamp illuminates**
5. Refer to the scan tool user guide.

SCAN TOOL DOES NOT COMMUNICATE WITH CHASSIS HIGH SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Chassis High Speed GMLAN Serial Data (+)	1	U0100-U02FF*	1	-
Chassis High Speed GMLAN Serial Data (-)	1	U0100-U02FF*	1	-
Ground (DLC, terminal 5)	-	1	-	-
* No communications with one or more chassis high speed GMLAN devices. An open in only one chassis high speed GMLAN serial data circuit may allow degraded communication between the devices. An open between the data link connector (DLC) and the first splice/device will only affect the communication with the scan tool. The devices will still communicate. 1. No communication with any chassis high speed GMLAN device.				

Circuit/System Description

The chassis high speed GMLAN bus functions the same as the primary high speed GMLAN bus, and the two buses operate in parallel. The chassis high speed GMLAN bus is added to reduce message congestion on the primary high speed bus. Since the chassis high speed GMLAN bus and primary high speed GMLAN bus operate in the same manner, the diagnostics for each are the same.

The serial data is transmitted on two twisted wires that allow speeds up to 500 kbit/s. The twisted pair is terminated with two 120 ohms resistors, one is internal to the electronic brake control module and the other can be a separate resistor in a connector assembly or in another device. The resistors are used as the load for the chassis high speed GMLAN bus during normal vehicle operation. The chassis high speed GMLAN is a differential bus. The chassis high speed GMLAN serial data bus (+) and chassis high speed GMLAN serial data (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds 1 V to the chassis high speed GMLAN serial data bus (+) circuit and subtracts 1 V from the chassis high speed GMLAN serial data bus (-) circuit. If serial data is lost, devices will set a no communication code against the non-communicating device. Note that a loss of serial data DTC does not represent a failure of the device that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A device on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more devices was interrupted during diagnosis.
 - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
 - If a loss-of-communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between some devices and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to those devices using multiple serial data communication systems.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC).

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify two or more devices are not communicating on the chassis high speed GMLAN serial data circuit. Refer to **Data Link References** to determine how many devices should be communicating on the bus.
 - **If only one device is not communicating**

Refer to Circuit/System Testing - Testing the Device Circuits.
 - **If two or more devices are not communicating**
3. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the scan tool from the X84 Data Link Connector. The following tests will be done at the X84 Data Link Connector. It may take up to 2 minutes for all vehicle systems to power down.
4. Test for less than 10 ohms between the ground circuit terminal 5 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

5. Ignition ON.

6. Test for less than 4.5 V between the serial data circuits listed below and ground.

- Terminal 12

- Terminal 13

- **If 4.5 V or greater**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Voltage.

- **If less than 4.5 V**

7. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.

8. Test for greater than 100 ohms between the serial data circuits listed below and ground.

- Terminal 12

- Terminal 13

- **If 100 ohms or less**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Ground.

- **If greater than 100 ohms**

9. Test for 50-70 ohms between the serial data circuit terminals 12 and 13.

- **If less than 35 ohms**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If between 35-50 ohms**

There may be a third terminating resistor between the serial data circuits. This can happen if the incorrect device is installed. Some devices are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness. Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If greater than 70 ohms but less than infinite**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for an Open/High Resistance.

- **If infinite resistance**

Repair the open/high resistance in the circuit between the X84 Data Link Connector and the first splice/device in the serial data circuit.

- **If between 50-70 ohms**

10. Refer to Circuit/System Testing - Testing the Device Circuits.

Circuit/System Testing

NOTE: Each device may need to be disconnected to isolate a circuit fault.

Use the schematic to identify the following:

- Chassis high speed GMLAN devices the vehicle is equipped with
- Chassis high speed GMLAN serial data circuit terminating resistors
- Device locations on the chassis high speed GMLAN serial data circuits
- Each device's ground, B+, ignition, and chassis high speed GMLAN serial data circuit terminals

Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition OFF, disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device, ignition ON.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 4.5 V or less**
 1. Ignition OFF.
 2. Test for less than 10 ohms between each of the device's ground circuit terminals and ground.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms, replace the device that was disconnected.
 - **If any serial data circuit is greater than 4.5 V**
3. Ignition OFF, disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, ignition ON.
4. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 4.5 V or less**
 1. Ignition OFF.
 2. Test for less than 10 ohms between each of the device's ground circuit terminals and ground.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms, replace the device that was disconnected.
 - **If any serial data circuit is greater than 4.5 V**

5. Repeat step 3 until one of the following conditions are isolated:
 - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
 - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device.
3. Test for greater than 100 ohms between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 100 ohms or greater**

Replace the device that was disconnected.

- **If any serial data circuit is less than 100 ohms**
4. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
 5. Test for greater than 100 ohms between each serial data circuit at the device connector that was just disconnected and ground.
 - **If both serial data circuits are 100 ohms or greater**

Replace the device that was disconnected.

- **If any serial data circuit is less than 100 ohms**
6. Repeat step 4 until one of the following conditions are isolated:
 - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
 - A short to ground on the serial data circuit between a device and a terminating resistor.
 - A short to ground on the serial data circuit between the X84 Data Link Connector and the first device or splice pack.

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for greater than 110 ohms between each pair of serial data circuits at the device connector that was just disconnected.
 - **If each pair of serial data circuits is 110 ohms or greater**

Replace the device that was disconnected.

- **If any pair of serial data circuits is less than 110 ohms**

4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
6. Test for greater than 110 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 110 ohms or greater**

Replace the device that was disconnected.

- **If any pair of serial data circuits is less than 110 ohms**

7. Repeat step 4 until one of the following conditions are isolated:
 - Serial data circuits shorted together between two devices or splice packs, if equipped.
 - Serial data circuits shorted together between a device and a terminating resistor.
 - Serial data circuits shorted together between the X84 Data Link Connector and the first device or splice pack.
 - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for less than 130 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuit is 130 ohms or less**

Replace the device that was disconnected.

- **If any pair of serial data circuits is greater than 130 ohms**

4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
6. Test for less than 130 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 130 ohms or less**

Replace the device that was disconnected.

- **If any pair of serial data circuits is greater than 130 ohms**

7. Repeat step 4 until one of the following conditions are isolated:

- An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
- An open/high resistance on the serial data circuit between a device and a terminating resistor.
- An open/high resistance terminating resistor.

Testing the Device Circuits

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors at an easily accessible device that is not communicating.
3. Test for less than 10 ohms between each ground circuit terminal and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected device.
 - **If the test lamp illuminates**
5. Ignition ON.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected device.
 - **If the test lamp illuminates**
7. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
- **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connectors at the control module that controls the ignition circuit.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the control module that controls the ignition circuit.
 - **If the test lamp illuminates**
8. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
9. Test for less than 130 ohms between each pair of chassis high speed GMLAN serial data circuits at the device connector that was just disconnected.
- **If any pair of serial data circuits is greater than 130 ohms**
- Repair the open/high resistance in the serial data circuits between the disconnected device and the circuit splice in the serial data circuits.
- **If each pair of serial data circuits is 130 ohms or less**
10. Replace the device that was disconnected.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **GMLAN and Media Oriented Systems Transport (MOST) Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

SCAN TOOL DOES NOT COMMUNICATE WITH HIGH SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Speed GMLAN Serial Data (+)	1	U0100-U02FF*	1	-
High Speed GMLAN Serial Data (-)	1	U0100-U02FF*	1	-
Ground (DLC, terminal 5)	-	1	-	-
* No communications with one or more high speed GMLAN devices. An open in only one high speed GMLAN serial data circuit may allow degraded communication between the devices. An open between the data link connector (DLC) and the first splice/device will only affect the communication with the scan tool. The devices will still communicate. 1. No communication with any high speed GMLAN device				

Circuit/System Description

The serial data is transmitted on two twisted wires that allow speeds up to 500 Kb/s. The twisted pair is terminated with two 120 ohms resistors, one is internal to the engine control module (ECM) and the other can be a separate resistor in a connector assembly or in another device. The resistors are used as the load for the High Speed GMLAN bus during normal vehicle operation. The high speed GMLAN is a differential bus. The high speed GMLAN serial data bus (+) and high speed GMLAN serial data bus (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds 1 V to the high speed GMLAN serial data bus (+) circuit and subtracts 1 V from the high speed GMLAN serial data bus (-) circuit. If serial data is lost, devices will set a no communication code against the non-communicating device. Note that a loss of serial data DTC does not represent a failure of the device that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A device on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more devices was interrupted during diagnosis.
 - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.

- Communication may be available between some devices and the scan tool with the high speed GMLAN serial data system inoperative. This condition is due to those devices using multiple serial data communication systems.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
- The engine will not start when there is a total malfunction of the high speed GMLAN serial data bus.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed GMLAN communications with the scan tool.
- These conditions may be caused by the installation of an aftermarket navigation radio module (see bulletins). Some customers may comment of one or more of the following concerns:
 - Vehicle will not crank
 - Vehicle cranks but will not start
 - Vehicle stability enhancement system warning lights and messages
 - PRNDL gear indicator position errors

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.

2. Verify two or more devices are not communicating on the high speed GMLAN serial data circuit. Refer to **Data Link References** to determine how many devices should be communicating on the bus.

- **If only one device is not communicating**

Refer to Circuit/System Testing - Testing the Device Circuits.

- **If two or more devices are not communicating**

3. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the scan tool from the X84 data link connector. The following tests will be done at the X84 data link connector. It may take up to 2 minutes for all vehicle systems to power down.

4. Test for less than 10 ohms between the ground circuit terminal 5 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

5. Ignition ON.

6. Test for less than 4.5 V between the serial data circuits listed below and ground.

- Terminal 6
- Terminal 14
- **If 4.5 V or greater**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Voltage.

- **If less than 4.5 V**

7. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.

8. Test for greater than 100 ohms between the serial data circuits listed below and ground.

- Terminal 6
- Terminal 14
- **If 100 ohms or less**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Ground.

- **If greater than 100 ohms**

9. Test for 50-70 ohms between the serial data circuit terminals 6 and 14.

- **If less than 35 ohms**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If between 35-50 ohms**

There may be a third terminating resistor between the serial data circuits. This can happen if the incorrect device is installed. Some devices are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness. Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If greater than 70 ohms but less than infinite**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for an Open/High Resistance.

- **If infinite resistance**

Repair the open/high resistance in the circuit between the X84 data link connector and the first splice/device in the serial data circuit.

- **If between 50-70 ohms**

10. Refer to Circuit/System Testing - Testing the Device Circuits.

Circuit/System Testing

NOTE: Each device may need to be disconnected to isolate a circuit fault.

Use the schematic to identify the following:

- High speed GMLAN devices the vehicle is equipped with
- High speed GMLAN serial data circuit terminating resistors
- Device locations on the high speed GMLAN serial data circuits
- Each device's ground, B+, ignition, and high speed GMLAN serial data circuit terminals

Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible device, ignition ON.
 2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 4.5 V or less**
1. Ignition OFF.

2. Test for less than 10 ohms between each of the device's ground circuit terminals and ground.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms, replace the device that was disconnected.
 - **If any serial data circuit is greater than 4.5 V**
3. Ignition OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, ignition ON.
4. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 4.5 V or less**
 1. Ignition OFF.
 2. Test for less than 10 ohms between each of the device's ground circuit terminals and ground.
 - If 10 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 10 ohms, replace the device that was disconnected.
 - **If any serial data circuit is greater than 4.5 V**
5. Repeat step 3 until one of the following conditions are isolated:
 - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
 - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible device.
3. Test for greater than 100 ohms between each serial data circuit at the device connector that was just disconnected and ground.
 - **If each serial data circuit is 100 ohms or greater**

Replace the device that was disconnected.

 - **If any serial data circuit is less than 100 ohms**
4. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
5. Test for greater than 100 ohms between each serial data circuit at the device connector that was just disconnected and ground.
 - **If both serial data circuits are 100 ohms or greater**

Replace the device that was disconnected.

 - **If any serial data circuit is less than 100 ohms**
6. Repeat step 4 until one of the following conditions are isolated:

- A short to ground on the serial data circuit between two devices or splice packs, if equipped.
- A short to ground on the serial data circuit between a device and a terminating resistor.
- A short to ground on the serial data circuit between the X84 data link connector and the first device or splice pack.

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for greater than 110 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 110 ohms or greater**

Replace the device that was disconnected.

- **If any pair of serial data circuits is less than 110 ohms**

4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
6. Test for greater than 110 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 110 ohms or greater**

Replace the device that was disconnected.

- **If any pair of serial data circuits is less than 110 ohms**

7. Repeat step 4 until one of the following conditions are isolated:
 - Serial data circuits shorted together between two devices or splice packs, if equipped.
 - Serial data circuits shorted together between a device and a terminating resistor.
 - Serial data circuits shorted together between the X84 data link connector and the first device or splice pack.
 - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for less than 130 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 130 ohms or less**

Replace the device that was disconnected.

- **If any pair of serial data circuits is greater than 130 ohms**

4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
6. Test for less than 130 ohms between each pair of serial data circuits at the device connector that was just disconnected.

- **If each pair of serial data circuits is 130 ohms or less**

Replace the device that was disconnected.

- **If any pair of serial data circuits is greater than 130 ohms**

7. Repeat step 4 until one of the following conditions are isolated:
 - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
 - An open/high resistance on the serial data circuit between a device and a terminating resistor.
 - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors at an easily accessible device that is not communicating.
3. Test for less than 10 ohms between each ground circuit terminal and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected device.
 - **If the test lamp illuminates**
- 5. Ignition ON.
- 6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the disconnected device.
 - **If the test lamp illuminates**
- 7. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connectors at the control module that controls the ignition circuit.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the control module that controls the ignition circuit.
 - **If the test lamp illuminates**
- 8. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
- 9. Test for less than 130 ohms between each pair of high speed GMLAN serial data circuits at the device connector that was just disconnected.
 - **If any pair of serial data circuits is greater than 130 ohms**

Repair the open/high resistance in the serial data circuits between the disconnected device and the circuit splice in the serial data circuits.
 - **If each pair of serial data circuits is 130 ohms or less**
- 10. Replace the device that was disconnected.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **GMLAN and Media Oriented Systems Transport (MOST) Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

SCAN TOOL DOES NOT COMMUNICATE WITH LOW SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Speed GMLAN Serial Data	1	U0100-U02FF*	1	-
Ground (DLC, terminal 5)	-	1*	-	-
* An open between the X84 Data Link Connector (DLC) and the first splice pack/device will only affect the communication with the scan tool. 1. No communication with any low speed GMLAN device				

Circuit/System Description

The serial data is transmitted over a single wire to the appropriate devices. The transmission speed for GMLAN low speed is up to 83.33 kbit/s. Under normal vehicle operating conditions, the speed of the bus is 33.33 kbit/s. The devices toggle the serial data circuit between 0-5 V during normal communications. To wake the devices connected to the low speed GMLAN serial data circuit, a voltage wake up pulse of 10 V is sent out. If serial data is lost, devices will set a no communication code against the non-communicating device. A loss of serial data communications DTC does not represent a failure of the device that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A device on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more devices was interrupted during diagnosis
 - A low battery condition was present, so some devices stop communicating when battery voltage

drops below a certain threshold.

- Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
- If a loss of communication U- code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with the low speed GMLAN serial data system inoperative. This condition is due to the device using both the high and low speed GMLAN systems.
- An open in the low speed GMLAN serial data circuit between the splice pack and a device will only affect that specific device. This type of failure will set a loss of communication DTC for each device affected, and the other devices will still communicate.
- An open in the X84 Data Link Connector (DLC) ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
- The engine may not start when there is a total malfunction of the low speed GMLAN serial data circuit.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed LAN communications with the scan tool.
- These conditions may be caused by the installation of an aftermarket navigation radio device (see bulletins). Some customers may comment of one or more of the following concerns:
 - Vehicle will not crank
 - Vehicle cranks but will not start
 - Vehicle stability enhancement system warning lights and messages
 - PRNDL gear indicator position errors

Circuit/System Verification

NOTE: Use the schematic to identify the following:

- **Devices the vehicle is equipped with**
- **Device and splice pack locations on the low speed GMLAN serial data circuit**
- **The low speed GMLAN serial data circuit terminals for each device or splice pack**

1. Attempt to communicate with all devices on the low speed GMLAN serial data circuit. Refer to **Data Link References**.

2. Verify which devices are communicating on the low speed GMLAN serial data circuit.

- **If only one device is not communicating**

Diagnose that device only. Refer to **DTC U0100-U02FF**.

- **If one or more devices are communicating but not all**

Refer to Circuit/System Testing - Testing the Serial Data Circuit for an Open/High Resistance.

- **If none of the devices are communicating**

3. Ignition OFF, all access doors closed, all vehicle systems OFF, all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the scan tool from the X84 Data Link Connector. The following tests will be done at the X84 Data Link Connector. It may take up to 2 minutes for all vehicle systems to power down.

4. Test for less than 10 ohms between the ground circuit terminal 5 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.

2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

5. Ignition ON.

6. Test for less than 4.5 V between the serial data circuit terminal 1 and ground.

- **If 4.5 V or greater**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Voltage.

- **If less than 4.5 V**

7. Ignition OFF, all access doors closed, all vehicle systems OFF, all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
8. Test for greater than 100 ohms between the serial data circuit terminal 1 and ground.

- **If 100 ohms or less**

Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Ground.

- **If greater than 100 ohms**

9. Disconnect the appropriate harness connector at the first splice pack closest in the circuit to the X84 Data Link Connector.
10. Test for less than 2 ohms between the X84 Data Link Connector's serial data circuit terminal 1 and the splice pack harness connector's serial data input terminal.

- **If 2 ohms or greater**

Repair the open/high resistance in the serial data circuit.

- **If less than 2 ohms**

11. Replace the splice pack.

Circuit/System Testing

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition OFF, disconnect the appropriate harness connectors at all low speed GMLAN serial data splice packs, ignition ON.
2. Test for less than 4.5 V between the serial data circuit terminal 1 at the X84 Data Link Connector and ground.

- **If 4.5 V or greater**

Repair the short to voltage on the serial data circuit.

- **If less than 4.5 V**

3. Test for less than 4.5 V between each low speed GMLAN serial data circuit at a splice pack and ground.

- **If any serial data circuit is greater than 4.5 V**

1. Ignition OFF, disconnect all devices on the failed serial data circuit, ignition ON.
2. Test for less than 1 V between each section of the failed serial data circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V

3. Connect the splice pack and connect the first device on the failed serial data circuit, ignition ON.
4. Verify the scan tool communicates or not with the low speed GMLAN serial data circuit.
 - If the scan tool does not communicate, replace the device that was just connected.
 - If the scan tool communicates and there are more devices to connect, connect the next device and repeat step 3.4.
 - If the scan tool communicates and there are no more devices to connect
5. All OK.
 - **If all serial data circuits are less than 4.5 V**
4. All OK.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the appropriate harness connectors at all low speed GMLAN serial data splice packs.
2. Test for infinite resistance between the serial data circuit terminal 1 at the X84 Data Link Connector and ground.
 - **If less than infinite resistance**

Repair the short to ground on the serial data circuit.

- **If infinite resistance**
3. Test for greater than 100 ohms between each low speed GMLAN serial data circuit at a splice pack and ground.
 - **If any serial data circuit is 100 ohms or less**
 1. Disconnect all devices on the failed serial data circuit.
 2. Test for infinite resistance between each section of the failed serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 3. Connect the splice pack and connect the first device on the failed serial data circuit, ignition ON.
 4. Verify the scan tool communicates or not with the low speed GMLAN serial data circuit.
 - If the scan tool does not communicate, replace the device that was just connected.
 - If the scan tool communicates and there are more devices to connect, connect the next device and repeat step 3.4.
 - If the scan tool communicates and there are no more devices to connect
 5. All OK.
 - **If all serial data circuits are greater than 100 ohms**
 4. All OK.

Testing the Serial Data Circuit for an Open/High Resistance

1. Ignition OFF and all vehicle systems OFF, disconnect the splice pack containing the devices that are not communicating on the low speed GMLAN serial data circuit.
2. Test for less than 2 ohms between the X84 Data Link Connector terminal 1 and the disconnected splice pack.

- **If 2 ohms or greater**

Repair the open/high resistance in the serial data circuit.

- **If less than 2 ohms**

3. Disconnect all devices on the failed serial data circuit.
4. Test for less than 2 ohms between each section of the failed serial data circuit end to end.

- **If 2 ohms or greater**

Repair the open/high resistance in the serial data circuit.

- **If less than 2 ohms**

5. Connect the splice pack and connect the first device on the failed serial data circuit.
6. Verify if the device communicates or not with the scan tool.

- **If the device does not communicates**

Replace the device.

- **If the device communicates and there are more devices to connect**

Connect the next device on the failed serial data circuit and repeat step 6.

- **If all devices are connected and communicating**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **GMLAN and Media Oriented Systems Transport (MOST) Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DATA LINK REFERENCES

This table identifies which serial data link that a particular device uses for in-vehicle data transmission. Some devices may use more than one data link to communicate. Some devices may have multiple communication circuits passing through them without actively communicating on that data link. This table is used to assist in correcting a communication malfunction. Not all devices listed will be applicable to all vehicles. Refer to the schematics to determine which devices apply. For the description and operation of these serial data communication circuits, refer to **Data Link Communications Description and Operation**.

REPAIR INSTRUCTIONS

BODY CONTROL MODULE REPLACEMENT

Fig. 11: Body Control Module
Courtesy of GENERAL MOTORS COMPANY

Body Control Module Replacement

Callout	Component Name
Preliminary Procedures 1. Prepare body control module for replacement. Refer to <u>Control Module References</u> . 2. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 3. Remove instrument panel lower reinforcement bracket. Refer to <u>Instrument Panel Lower Reinforcement Bracket Replacement</u> .	
1	Body Control Module Procedure 1. Disconnect electrical connector. 2. Unclip body control module from body control module bracket.

3. After replacement, refer to **Control Module References** for programming and set up procedures.

BODY CONTROL MODULE BRACKET REPLACEMENT

Fig. 12: Body Control Module Bracket
Courtesy of GENERAL MOTORS COMPANY

Body Control Module Bracket Replacement

Callout	Component Name
Preliminary Procedures	
1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
2. Remove the body control module. Refer to <u>Body Control Module Replacement</u> .	
1	Body Control Module Bracket Nut (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> .
2	Body Control Module Bracket

DESCRIPTION AND OPERATION

BODY CONTROL SYSTEM DESCRIPTION AND OPERATION

The body control system consists of the body control module (BCM), communications, and various input and outputs. Some inputs, outputs and messages require other modules to interact with the BCM. The BCM also has discrete input and output terminals to control the vehicle's body functions. The BCM is wired to the high speed GMLAN serial data bus, low speed GMLAN serial data bus and Multiple LIN buses and acts as a gateway between them.

Power Mode Master

This vehicle body control module (BCM) functions as the power mode master (PMM). The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determining the power mode that will be sent over the serial data circuits to the other modules that need this information; the PMM will activate relays and other direct outputs of the PMM as needed. Refer to **Power Mode Description and Operation** for a complete description of power mode functions.

Gateway

The body control module (BCM) in this vehicle functions as a gateway or translator. The purpose of the gateway is to translate serial data messages between the GMLAN high speed bus and the GMLAN low speed bus for communication between the various modules. The gateway will interact with each network according to that network's transmission protocol.

All communication between the BCM and a scan tool is on the high speed GMLAN serial data circuits. A lost communication DTC typically is set in modules other than the module with a communication failure.

Body Control

The various body control module (BCM) input and output circuits are illustrated in the corresponding functional areas on the BCM electrical schematics. Refer to the **Body Control System Schematics** for more detailed information.

DATA LINK COMMUNICATIONS DESCRIPTION AND OPERATION

NOTE: This is an overview of different serial data buses used by GM devices to communicate with each others. Use **Data Communication Schematics** to find out which serial data buses are configured for a specific vehicle.

Circuit Description

There are many components in a vehicle that rely on information from other sources, transmit information to other sources, or both. Serial data communication networks provide a reliable, cost effective, way for various components of the vehicle to "talk" to one another and share information.

GM uses a number of different communication buses to insure the timely and efficient exchange of information between devices. When compared to each other, some of these buses are different in nature as far as speed, signal characteristics, and behavior. An example of this is the High Speed GMLAN and Low Speed GMLAN buses.

On the other hand, when other buses are compared to each other they have similar characteristics and simply

operate in parallel. In this case they are used to group together components which have high interaction. Examples are the High Speed GMLAN, Powertrain Expansion, and Chassis Expansion buses. This allows them to communicate with each other on a bus with reduced message congestion insuring faster and the more timely exchange of information than if all vehicle devices were on a single bus.

The majority of information that exists within a given network generally stays local; however some information will have to be shared on other networks. Control modules designated as Gateway's perform the function of transferring information between the various buses. A Gateway module is connected to at least 2 buses and will interact with each network according to its message strategy and transmission models.

GMLAN provides the capability for a receiving device to monitor message transmissions from other devices in order to determine if messages of interest are not being received. The primary purpose is to allow reasonable default values to be substituted for the information no longer being received. Additionally, a device may set a Diagnostic Trouble Code to indicate that the device it is expecting information from is no longer communicating.

High Speed GMLAN Circuit Description

A High Speed GMLAN Bus is used where data needs to be exchanged at a high enough rate to minimize the delay between the occurrence of a change in sensor value and the reception of this information by a control device using the information to adjust vehicle system performance.

The High Speed GMLAN serial data network consists of two twisted wires. One signal circuit is identified as GMLAN-High and the other signal circuit is identified as GMLAN-Low. At each end of the data bus there is a 120 ohms termination resistor between the GMLAN-High and GMLAN-Low circuits.

Data symbols (1's and 0's) are transmitted sequentially at a rate of 500 Kbit/s. The data to be transmitted over the bus is represented by the voltage difference between the GMLAN-High signal voltage and the GMLAN-Low signal voltage.

When the two wire bus is at rest the GMLAN-High and GMLAN-Low signal circuits are not being driven and this represents a logic "1". In this state both signal circuits are at the same voltage of 2.5 V. The differential voltage is approximately 0 V.

When a logic "0" is to be transmitted, the GMLAN-High signal circuit is driven higher to about 3.5 V and the GMLAN-Low circuit is driven lower to about 1.5 V. The differential voltage becomes approximately 2.0 (+/- 0.5) V.

Chassis High Speed GMLAN Circuit Description

The GMLAN Chassis Expansion Bus is basically a copy of the High Speed GMLAN Bus except that its use is reserved for chassis components. This implementation splits message congestion between two parallel buses helping to insure timely message transmission and reception. Sometimes communication is required between the Chassis Expansion Bus and the primary High Speed GMLAN Bus. This is accomplished by using the K17 Electronic Brake Control Module (EBCM) as the Gateway module. Since the High Speed GMLAN Chassis Expansion Bus and primary High Speed GMLAN Bus operate in the same manner, the diagnostics for each are similar.

Object High Speed GMLAN Circuit Description

The GMLAN Object Bus is basically a copy of the High Speed GMLAN Bus except that its use is reserved for the enhanced safety system. This implementation is used to isolate the heavy communication among the enhanced safety system devices from the other vehicle buses, reducing congestion. The K124 Active Safety Control Module is connected to the Object Bus as well as the Primary High Speed GMLAN Bus, the Chassis Expansion Bus, and the Low Speed GMLAN Bus. The K124 Active Safety Control Module acts as a Gateway module for all required communication between the Object Bus devices and devices on these other vehicle buses. The GMLAN Object Bus operates in the same manner as the Chassis Expansion and Primary High Speed buses and so the diagnostics are similar. The Object Bus is physically partitioned into a Front Object Bus and a Rear Object Bus with each partition having its own communication enable circuit to activate the partition, but functional operation of both is identical. The Front Object Bus standard devices are the K124 Active Safety Control Module, the K109 Frontview Camera Module, and the B233B Radar Sensor Module - Long Range. The Front Object Bus optional devices are the B233LF Radar Sensor Module - Short Range Left Front and the B233RF Radar Sensor Module - Short Range Right Front. The Rear Object Bus is optional and when present will have the K124 Active Safety Control Module and B233R Radar Sensor Module - Short Range Rear on the bus, and optionally the Radar Sensor Module - Short Range Right Rear. All Object Bus components are powered by the K124 Active Safety Control Module via the communication enable circuits, except the K109 Frontview Camera Module which is powered directly by battery.

Media Oriented Systems Transport (MOST) Circuit Description

The MOST Infotainment network is a dedicated high speed multimedia streaming data bus independent from GMLAN. The MOST bus will be configured in a physical hardwired loop with each device within the bus sends and receives data on an assigned MOST addresses in a set order. Each device on the MOST bus will be required to have twisted pair copper wires (2 transmit TX, 2 receive RX, and 1 electronic control line which is a 12 V wakeup signal line). The A11 Radio is the MOST Master and will monitor the bus for vehicle configuration, Infotainment data messages and errors on the bus. The MOST initialization consists of a short 100 ms low voltage pulse on the electronic control line (or MOST control line) connected to all devices contained on the MOST ring. This wakeup message once received by each device, will first respond with a generic device response. Once these initial responses on the MOST bus are reported successfully without error to the A11 Radio, the second data request will record the MOST device addresses, their functionality requirements and capabilities within. The A11 Radio will learn this information and also record the address node sequence on the MOST bus at this point. This node address list will now be stored within the A11 Radio as the MOST bus configuration (called "Last Working MOST ID of Node 1 - 9" on scan tool data display).

When MOST receive, transmit, or control line faults are detected, transmit/receive messages will not received as expected from the wakeup request. The A11 Radio and the K74 Human Machine Interface Control Module will then perform diagnostics to isolate these MOST faults. If the MOST control line is shorted low to 0 V for excess amount of time, the A11 Radio will set a U2098 DTC and K74 Human Machine Interface Control Module will set a U0029 02 DTC. At this point the MOST bus will be unable to communicate until the shorted MOST control line is repaired.

Once the shorted MOST control line diagnostics pass, the A11 Radio will attempt to resend the initial short pulse attempts up to 3 times on the MOST control line. If the expected responses are not received, the A11 Radio continues into a failure mode setting a U0028 DTC and will continue on to send one 300 ms long pulse, which will enable the furthest upstream transmitting device to become the surrogate MOST Master in this MOST fault/diagnostic mode. When the A11 Radio receives this new MOST Master identity, the surrogate

MOST master device can be identified based on scan tool data parameter "Surrogate MOST Master Node Upstream Position". The scan tool should be used to determine the MOST bus configuration and direction by utilizing the "Last Working MOST ID of Node 1 - 9" parameters from the A11 Radio data display. When a fault is present, it will indicate the newly enabled "Surrogate MOST Master Node Upstream Position" from the A11 Radio. This will assist in determining where the MOST bus/control is at fault. The MOST device upstream from the surrogate MOST master device, transmit, receive, or control lines will be the suspect areas for diagnostics at this point. These faults can be associated with any of the MOST transmit, receive, or control line twisted copper wires or possibly an internal device fault.

The K74 Human Machine Interface Control Module will set a U0029 00 DTC when it diagnoses a MOST bus not communicating properly after one attempt. When the DTC U0029 00 is set by the K74 Human Machine Interface Control Module without the corresponding DTC U0028 from the A11 Radio, it will be an indication of an intermittent wiring/device condition.

CAN Graphical Interface (CGI) Circuit Description

This bus is used by the Entertainment sub-system to transfer high-rate display graphics between the A11 Radio and the P17 Info Display Module and/or Radio/HVAC Control. The electrical characteristics of the CAN Graphical Interface (CGI) Bus are very similar to the High Speed GMLAN Bus. The message strategy and construction of messages are different however. Sometimes communication is required between the CAN Graphical Interface Bus and the Low Speed GMLAN Bus. This is accomplished by using the A11 Radio as the Gateway module. Since the CAN Graphical Interface Bus and primary High Speed GMLAN Bus have similar electrical characteristics, the diagnostics for each are similar.

In the case where the P17 Info Display Module and Radio/HVAC Control are separate devices the P17 Info Display Module is responsible for passing information between the A11 Radio and the Radio/HVAC Control. The A11 Radio interfaces only with the P17 Info Display Module and the P17 Info Display Module then communicates with the Radio/HVAC Control through a Local Interconnect Network (LIN) interface.

A bus wake up signal will be generated by the A11 Radio or by the P17 Info Display Module when the system functionality is required. The communication function of the CAN Graphical Interface shall be enabled or disabled based on the voltage level of the Center Stack Wake. The network will stay awake as long as the circuit voltage is driven low, to less than 1.5 V. Communications are disabled with a high circuit voltage around 5.0 V.

The A11 Radio can execute a warm reset of the P17 Info Display Module if the P17 Info Display Module fails to respond to the A11 Radio's request. The Center Stack Reset is a low-asserted pull down output (less than 1.5 V) from the A11 Radio to the P17 Info Display Module and has the same electrical characteristics as those for the Center Stack Wake signal defined above.

Mid Speed GMLAN Circuit Description

The Mid Speed GMLAN Bus is very similar to the High Speed GMLAN Bus except that it uses a slower transmission rate of 125 Kbit/s. This bus is intended for use where the system response time demands that a large amount of data be transmitted in a relatively short amount of time, such as updating a graphics display. As such it has usually been used for infotainment applications. Sometimes communication is required between the Low Speed GMLAN Bus and the Mid Speed GMLAN Bus. This is accomplished by using the A11 Radio as the Gateway module. Since the Mid Speed GMLAN Bus and primary High Speed GMLAN Bus operate in a

similar manner, the diagnostics for each are similar.

Low Speed GMLAN Circuit Description

Low Speed GMLAN Bus is used in applications where a high data rate is not required which allows for the use of less complex components. It is typically used for operator controlled functions where the response time requirements are slower than those required for dynamic vehicle control.

The Low Speed GMLAN Serial Data Network consists of a single wire, ground referenced bus with high side voltage drive. During on road vehicle operation data symbols (1's and 0's) are transmitted sequentially at the normal rate of 33.3 Kbit/s. For component programming only, a special high speed data mode of 83.3 Kbit/s may be used.

Unlike the high speed dual wire networks, the single wire low speed network does not use terminating resistors at either end of the network.

The data symbols to be transmitted over the bus are represented by different voltage signals on the bus. When the Low Speed GMLAN Bus is at rest and is not being driven, there is a low signal voltage of approximately 0.2 V. This represents a logic "1". When a logic "0" is to be transmitted, the signal voltage is driven higher to around 4.0 V or higher.

Local Interconnect Network (LIN) Circuit Description

The Local Interconnect Network (LIN) Bus consists of a single wire with a transmission rate of 10.417 Kbit/s. This bus is used to exchange information between a master control module and other smart devices which provide supporting functionality. This type of configuration does not require the capacity or speed of either a High Speed GMLAN Bus or Low Speed GMLAN Bus and is thus relatively simpler.

The data symbols (1's and 0's) to be transmitted are represented by different voltage levels on the communication bus. When the LIN Bus is at rest and is not being driven, the signal is in a high voltage state of approximately V_{batt} . This represents a logic "1". When a logic "0" is to be transmitted, the signal voltage is driven low to about ground (0.0 V).

Communication Enable Circuit Description

Devices on High Speed GMLAN Bus enable or disable communication based on the voltage level of the communication enable circuit. When the circuit voltage is high (around 12 V), communications are enabled. When the circuit is low, communications are disabled.

Data Link Connector (DLC)

The X84 Data Link Connector (DLC) is a standardized 16-cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Terminal 1 Low speed GMLAN communications terminal
- Terminal 2 Class 2 communications terminal
- Terminal 3 Mid speed GMLAN serial bus (+) terminal or Object high speed GMLAN serial bus (+) terminal

- Terminal 4 Scan tool power ground terminal
- Terminal 5 Common signal ground terminal
- Terminal 6 High speed GMLAN serial data bus (+) terminal
- Terminal 7 Keyword communications terminal
- Terminal 11 Mid speed GMLAN serial bus (-) terminal or Object high speed GMLAN serial bus (-) terminal
- Terminal 12 Chassis high speed GMLAN serial bus (+) terminal
- Terminal 13 Chassis high speed GMLAN serial bus (-) terminal
- Terminal 14 High speed GMLAN serial data bus (-) terminal
- Terminal 16 Scan tool power, battery positive voltage terminal

Serial Data Reference

The scan tool communicates over the various buses on the vehicle. When a scan tool is installed on a vehicle, the scan tool will try to communicate with every device that could be optioned into the vehicle. If an option is not installed on the vehicle, the scan tool will display No Comm (or Not Connected) for that optional device. In order to avert misdiagnoses of No Communication with a specific device, refer to **Data Link References** for a list of devices, the buses they communicate with, and the RPO codes for a specific device.

DIAGNOSTIC INFORMATION AND PROCEDURES

BRAKE ROTOR THICKNESS MEASUREMENT

WARNING: Refer to Brake Dust Warning .

1. If the inboard friction surface of the brake rotor is not accessible, reposition and support the caliper with the brake pads. Refer to **Front Disc Brake Pads Replacement**.

Fig. 1: Micrometer On Brake Rotor
Courtesy of GENERAL MOTORS COMPANY

2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
3. Using a micrometer (1) calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the thickness of the brake rotor at four or more points, evenly spaced around the brake rotor.

Make sure that the measurements are only taken within the friction surfaces and that the micrometer is positioned the same distance from the outer edge of the brake rotor, about 13 mm (1/2 in), for each measurement.

4. Compare the lowest thickness measurement recorded to the following specifications:

Specification - Front

- Brake rotor minimum allowable thickness after refinishing: 18.20 mm (0.717 in)
 - Brake rotor discard thickness: 18.00 mm (0.709 in)
5. If the lowest thickness measurement of the brake rotor is above the minimum allowable thickness after refinishing specification, the brake rotor may be able to be refinished, depending upon surface and wear conditions which may be present.
 6. If the lowest thickness measurement of the brake rotor is at or below the minimum allowable thickness after refinishing specification, the brake rotor may not be refinished.
 7. If the lowest thickness measurement of the brake rotor is at or below the discard thickness specification, the brake rotor requires replacement.

BRAKE ROTOR THICKNESS VARIATION MEASUREMENT

WARNING: Refer to Brake Dust Warning .

NOTE: Any disc brake rotor that exhibits thickness variation exceeding the maximum acceptable level must be refinished or replaced. Thickness variation exceeding the maximum acceptable level can cause brake pulsation.

1. If the inboard friction surface of the brake rotor is not accessible, reposition and support the caliper with the brake pads. Refer to Front Disc Brake Pads Replacement.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.

Fig. 2: Micrometer On Brake Rotor
Courtesy of GENERAL MOTORS COMPANY

3. Using a micrometer (1) calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the thickness of the brake rotor at 4 or more points, evenly spaced around the brake rotor.

Make sure that the measurements are only taken within the friction surfaces and that the micrometer is positioned the same distance from the outer edge of the brake rotor, about 13 mm (1/2 in), for each measurement.

4. Calculate the difference between the highest and lowest thickness measurements recorded to obtain the amount of thickness variation.

NOTE: Whenever a brake rotor is refinished or replaced, the assembled lateral runout (LRO) of the brake rotor must be measured to make sure optimum performance of the disc brakes.

5. Compare the thickness variation measurement to the following specification:

Specification

Brake rotor maximum allowable thickness variation: 0.001 mm (0.0004 in).

6. If the brake rotor thickness variation measurement exceeds the specification, the brake rotor requires refinishing or replacement.

BRAKE ROTOR SURFACE AND WEAR INSPECTION

WARNING: Refer to **Brake Dust Warning** .

1. If the inboard friction surface of the brake rotor is not accessible, reposition and support the caliper with the brake pads. Refer to **Front Disc Brake Pads Replacement**.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
3. Inspect the friction surfaces of the brake rotor for the following braking surface conditions:
 - Heavy rust and/or pitting

Light surface rust can be removed with an abrasive disc. Heavy surface rust and/or pitting must be removed by refinishing the brake rotor.

- Cracks and/or heat spots
 - Too much blueing discoloration
4. If the friction surfaces of the brake rotor exhibit one or more of the braking surface conditions, the brake rotor requires refinishing or replacement.

Fig. 3: Micrometer On Brake Rotor
Courtesy of GENERAL MOTORS COMPANY

5. Using a micrometer (1) calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the scoring depth of any grooves present on the brake rotor friction surfaces.
6. Compare the groove scoring depth recorded to the following specification:

Specification

Brake rotor maximum allowable scoring: 1.50 mm (0.059 in).

7. If the brake disc rotor scoring depth exceeds the specification, or if an excessive amount of scoring is present, the brake rotor requires refinishing or replacement.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT MEASUREMENT

Special Tools

- **CH-41013** Rotor Surfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit
- **CH-45101** Hub and Wheel Runout Gauge
- **CH-45101-100** Conical Brake Rotor Washers

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to Brake Dust Warning .

NOTE:

- **Brake rotor assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4, 800-11, 300 km (3, 000-7, 000 mi).**
- **Brake rotor thickness variation MUST be inspected BEFORE inspecting for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.**

1. Matchmark the position of the brake rotor to the wheel studs if this has not been done already.

NOTE:

Whenever the brake rotor has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in excessive assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.

2. Inspect the mating surface of the hub/axle flange and the brake rotor to make sure that there are no foreign particles, corrosion, rust, or debris remaining. If the wheel hub/axle flange and/or brake rotor mating surfaces exhibit these conditions, perform the following steps:
 1. Remove the brake rotor from the vehicle. Refer to **Front Brake Rotor Replacement**.
 2. Using the **CH-42450-A** wheel hub resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
 3. Using the **CH-41013** rotor resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the brake rotor.
 4. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
3. Install the rotor to the hub/axle flange using the matchmark made prior to removal.

Fig. 4: One Lug Nut & Conical Brake Rotor Washers
Courtesy of GENERAL MOTORS COMPANY

4. Hold the brake rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** conical brake rotor washers (1), and one lug nut (2) onto the upper-most wheel stud.
5. Continue to hold the brake rotor secure and tighten the lug nut firmly by hand.

Fig. 5: Wheel Studs

Courtesy of GENERAL MOTORS COMPANY

6. Install the remaining **CH-45101-100** conical brake rotor washers (1) and lug nuts onto the wheel studs and tighten the nuts firmly by hand in the tightening sequence.
7. Tighten the lug nuts in sequence, in order to properly secure the rotor. Refer to **Tire and Wheel Removal and Installation** .
8. If the brake rotor has been REFINISHED or REPLACED with a new rotor, proceed to step 14.
9. If the brake rotor meets the following criteria, proceed to step 10.
 - The rotor is within specifications and is being REUSED.
 - The rotor has NOT been refinished.
 - The rotor does not exhibit thickness variation exceeding the maximum allowable level.

Fig. 6: Hub And Wheel Runout Gauge
Courtesy of GENERAL MOTORS COMPANY

10. Mount a dial indicator, **CH-45101** hub and wheel runout gauge (1), or equivalent, to the steering knuckle and position the indicator button so it contacts the brake rotor friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the rotor.
11. Measure and record the assembled LRO of the brake rotor:
 1. Rotate the rotor until the lowest reading is displayed on the indicator dial, then set the dial to zero.
 2. Rotate the rotor until the highest reading is displayed on the dial.
 3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
 4. Measure and record the amount of assembled LRO.
12. Compare the brake rotor assembled LRO to the following specification:

Specification

Front brake rotor maximum allowable assembled lateral runout: 0.06 mm (0.002 in)

13. If the brake rotor assembled LRO is within specifications, proceed to step 18.

If the brake rotor assembled LRO exceeds the specification, refinish the rotor to ensure true parallelism. Refer to **Brake Rotor Refinishing**. After refinishing the rotor, proceed to step 14.

14. Mount a dial indicator, **CH-45101** hub and wheel runout gauge, or equivalent, to the steering knuckle and position the indicator button so it contacts the brake rotor friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the rotor.
15. Measure and record the assembled LRO of the brake rotor.
 1. Rotate the rotor until the lowest reading is displayed on the indicator dial, then set the dial to zero.
 2. Rotate the rotor until the highest reading is displayed on the dial.
 3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
 4. Measure and record the amount of assembled LRO.
16. Compare the brake rotor assembled LRO to the following specification:

Specification

Front brake rotor maximum allowable assembled lateral runout: 0.06 mm (0.002 in).

17. If the brake rotor assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to **Brake Rotor Assembled Lateral Runout Correction**.
18. If the brake rotor assembled LRO measurement is within specification, install the brake caliper and depress the brake pedal several times to secure the brake rotor in place before removing the **CH-45101-100** conical brake rotor washers and the lug nuts.

BRAKE PAD INSPECTION

Fig. 7: Disc Brake Pads And Audible Wear Sensors
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Dust Warning .

1. Inspect the disc brake pads at regular intervals, or whenever the tire and wheel assemblies are removed from the vehicle.
2. If replacement is necessary, always replace disc brake pads in axle sets.
3. Inspect both edges of the disc brake pad friction surfaces (3). The highest rate of wear normally occurs at the trailing edge of the disc brake pads.
4. Inspect the thickness of the disc brake pads (3) in order to ensure that they have not worn prematurely. The disc brake pad wear should be approximately even per axle set.
5. Front brake pads have integral, audible wear sensors (1). When the disc brake pad wear reaches the minimum allowable thickness, the wear sensor contacts the disc brake rotor (2). The wear indicator will then produce an audible, high-pitched warning noise during wheel rotation.
6. Replace the disc brake pads when the friction surface (3) is worn to within 2.00 mm (0.079 in) of the mounting plates.
7. Verify that any disc brake pad shims that may be required are in place and not damaged or excessively corroded. Replace any missing or damaged shims in order to preserve proper disc brake performance.
8. Replace the disc brake pads if any have separated from the mounting plates.

9. Inspect the disc brake pads friction surfaces for cracks, fractures, or damage which may cause noise or otherwise impair disc brake performance.

BRAKE CALIPER INSPECTION

Fig. 8: Brake Caliper Components
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Dust Warning .

1. Inspect the brake caliper housing (1) for cracks, excess wear, and/or damage. If any of these conditions are present, the brake caliper requires replacement.
2. Inspect the caliper piston dust boot seal (2) for cracks, tears, cuts, deterioration and/or improper seating in the caliper body. If any of these conditions are present, the brake caliper requires overhaul or replacement.
3. Inspect for brake fluid leakage around the caliper piston boot seal (6) and on the disc brake pads. If there is any evidence of brake fluid leakage, the brake caliper requires overhaul or replacement.

Fig. 9: Brake Caliper, Inner Brake Pad And C-Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Inspect for smooth and complete travel of the caliper pistons into the caliper bores:
 - The movement of the caliper pistons into the caliper bores should be smooth and even. If the caliper piston is frozen or difficult to bottom, the caliper requires overhaul or replacement.
 - Insert a discarded inner brake pad (2) or block of wood in front of the piston. Using a large C-clamp (1) installed over the body of the caliper (3) and against the brake pad or block of wood, slowly bottom the piston in the bore.

FRONT DISC BRAKE MOUNTING AND HARDWARE INSPECTION

WARNING: Refer to **Brake Dust Warning** .

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level then no brake fluid needs to be removed from the reservoir before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level then remove brake fluid to the midway point before proceeding.

Fig. 10: Brake Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
5. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
6. Grasp the brake caliper housing and try to move the brake caliper housing up/down and forward/reverse in relation to the brake caliper mounting bracket (3). If excessive looseness is observed the brake caliper bracket bushings and/or the brake caliper mounting bolts may need to be replaced.
7. Compress the front caliper pistons.
 - Install a large C-clamp over the top of the caliper housing and against the back of the outboard pad (1).
 - Slowly tighten the C-clamp until the pistons are pushed completely into the caliper bores.
 - Remove the C-clamp from the caliper.
8. With the pistons compressed into the caliper bores, grasp the brake caliper housing and slide it back and forth on the brake caliper mounting bolts. Check for smooth operation. If the brake caliper housing slide force is high or the brake caliper housing does not slide smoothly, inspect the brake caliper mounting bolts and/or the brake caliper mounting bracket bushings for wear or damage. If wear or damage conditions are found, replacement of the brake caliper mounting bolts and/or the brake caliper mounting bracket bushings is necessary.
9. Remove the brake caliper mounting bolts from the brake caliper mounting bracket and support the brake caliper using heavy mechanics wire. Do not remove the hydraulic brake hose from the caliper. Refer to

Front Brake Caliper Replacement.

10. Remove the disc brake pads (1, 4) from the brake caliper mounting bracket (3).
11. Inspect the disc brake pad mounting hardware for the following:
 - Missing mounting hardware
 - Excessive corrosion
 - Bent mounting tabs (2)
 - Looseness at the brake caliper mounting bracket (3)
 - Looseness at the disc brake pads (1, 4)
 - Excessive contaminants in the brake caliper mounting bracket surface and threads
12. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.
13. Ensure the disc brake pads are held firmly in place on the brake caliper mounting bracket, yet slide easily on the mounting hardware without binding.

Fig. 11: Caliper Bolts

Courtesy of GENERAL MOTORS COMPANY

14. Inspect the caliper bolts (1) for the following:
 - Binding
 - Seizing
 - Looseness in the brake caliper mounting bracket (3)

- Bent or damaged brake caliper mounting bolts
 - Cracked or torn boots (4)
 - Missing boots
 - Bent or damaged brake caliper mounting bracket (3)
15. If any of the conditions listed are found then the brake caliper mounting hardware requires replacement.
 16. Install the disc brake pads to the brake caliper mounting bracket.
 17. Install the disc brake caliper to the brake caliper mounting bracket. Refer to **Front Brake Caliper Replacement**.

REPAIR INSTRUCTIONS

FRONT DISC BRAKE PADS REPLACEMENT

Removal Procedure

WARNING: Refer to **Brake Dust Warning** .

NOTE: **Always replace disc brake pads in axle sets.**

1. Inspect the fluid level in the master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluids needs to be removed from the reservoir before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding.
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
5. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

Fig. 12: Brake Caliper Lower Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

6. Remove the brake caliper lower guide pin bolt (1).

Fig. 13: Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

7. Without disconnecting the hydraulic brake flexible hose, pivot the caliper upward and secure the caliper with heavy mechanics wire, or equivalent.
8. Remove the inboard brake pad (1) from the caliper mounting bracket (3).

Note the location of the brake pad audible wear sensor.

9. Remove the outboard brake pad (2) from the caliper mounting bracket (3).

Fig. 14: Brake Pad Retainers

Courtesy of GENERAL MOTORS COMPANY

10. Remove the brake pad retainers (1) from the caliper bracket (2).
11. Inspect the disc brake mounting and hardware. Refer to **Front Disc Brake Mounting and Hardware Inspection**.

Installation Procedure

Fig. 15: Brake Caliper, Inner Brake Pad And C-Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install a large C-clamp (1) over the body of the brake caliper (3), with the C-clamp ends against the rear of the caliper body and against an old inboard brake pad (2) or a wood block installed against the caliper pistons.
2. Tighten the C-clamp evenly until the caliper piston is compressed completely into the caliper bore.
3. Remove the C-clamp and the old brake pad or wood block from the caliper.

Fig. 16: Brake Pad Retainers

Courtesy of GENERAL MOTORS COMPANY

4. Install the brake pad retainers (1) to the caliper bracket (2).

Fig. 17: Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

NOTE: The wear sensor equipped disc brake pad must be mounted inboard of the rotor with the leading edge of the sensor facing the brake rotor during forward wheel rotation, or at the top of the pad when installed in vehicle position.

5. Install the brake pads (1, 2) to the caliper bracket (3).
6. Remove the support, and rotate the brake caliper into position over the disc brake pads and to the caliper mounting bracket.

Fig. 18: Brake Caliper Lower Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

7. Install the lower brake caliper guide pin bolt (1) and tighten to 28 (21 lb ft).
8. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
9. Lower the vehicle.
10. With the engine OFF, gradually apply the brake pedal approximately 2/3 of its travel distance.
11. Slowly release the brake pedal.
12. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
13. Fill the master cylinder reservoir to the proper level. Refer to **Master Cylinder Reservoir Filling** .
14. Burnish the pads and rotors. Refer to **Brake Pad and Rotor Burnishing**.

BRAKE PAD AND ROTOR BURNISHING

WARNING: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control.

Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

Burnishing the brake pads and brake rotors is necessary in order to ensure that the braking surface are properly prepared after service has been performed on the disc brake system.

This procedure should be performed whenever the disc brake rotors have been refinished or replaced, and/or whenever the brake pads have been replaced.

1. Select a smooth road with little or no traffic.
2. Accelerate the vehicle to 48 km/h (30 mph).

NOTE: Use care to avoid overheating the brakes while performing this step as it may adversely affect the heating characteristics of the NEW brake pad material.

3. Using moderate pressure, apply the brakes to bring the vehicle to a stop. Do not allow the brakes to lock.
4. Repeat steps 2 and 3 until approximately 20 stops have been completed. Allow sufficient cooling periods between stops in order to properly burnish the brake pads and rotors.

FRONT BRAKE CALIPER REPLACEMENT

WARNING: Refer to Brake Dust Warning .

WARNING: Refer to Brake Fluid Irritant Warning .

Removal Procedure

1. Inspect the fluid level in the master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed from the reservoir before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove the brake fluid to the midway point before proceeding.
4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
5. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .

Fig. 19: Brake Caliper And Caliper Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Remove the brake hose-to-caliper bolt (1) from the brake caliper.
7. Remove the brake hose (3) from the brake caliper.
8. Remove and discard the 2 copper brake hose washers (2). These washers may be stuck to the brake caliper and/or the brake hose end (3).
9. Cap or plug the opening in the brake caliper and the brake hose to prevent fluid loss and contamination.

Fig. 20: Brake Caliper Guide Pin Bolts
Courtesy of GENERAL MOTORS COMPANY

10. Remove the brake caliper guide pin bolts (1).
11. Remove the brake caliper from the caliper brackets.
12. Inspect the brake caliper guide pins for freedom of movement, and inspect the condition of the guide pin boots. Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:
 - Restricted caliper guide pin movement
 - Looseness in the brake caliper mounting bracket
 - Seized and binding caliper guide pins
 - Split or torn boots
13. If any of the conditions listed are found, the brake caliper guide pins and/or boots require replacement.

Installation Procedure

Fig. 21: Brake Caliper Guide Pin Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the brake caliper to the brake caliper bracket.

CAUTION: Refer to Fastener Caution .

2. Install the brake caliper guide pin bolts (1) and tighten to 28 N.m (21 lb ft).

Fig. 22: Brake Caliper And Caliper Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove the caps or plugs from the brake caliper opening and the brake hose (3).

NOTE: Do not reuse the copper brake hose washers.

4. Install NEW copper brake hose washers (2) to the brake hose-to-caliper bolt (1) and to the brake hose (3).
5. Install the brake hose (3) and the brake hose-to-caliper bolt (1) to the brake caliper and tighten to 40 N.m (30 lb ft).
6. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** , **Hydraulic Brake System Bleeding (Pressure)** .
7. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.
9. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
10. Slowly release the brake pedal.
11. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.

FRONT BRAKE CALIPER OVERHAUL

WARNING: Refer to Brake Dust Warning .

WARNING: Refer to Brake Fluid Irritant Warning .

Removal Procedure

Fig. 23: Brake Caliper With Heavy Mechanic's Wire
Courtesy of GENERAL MOTORS COMPANY

WARNING: Do not place fingers in front of the caliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious bodily injury.

CAUTION: Use clean cloths to pad interior of caliper housing during piston removal. Use just enough air to ease the pistons out of the bores. If the pistons are blown out, even with the padding provided, it may be damaged.

1. Remove the brake caliper from the vehicle. Refer to Front Brake Caliper Replacement.

2. Remove the brake caliper piston from the caliper bore by directing low pressure compressed air into the caliper bore through the fluid inlet hole.

Fig. 24: New Piston Seal
Courtesy of GENERAL MOTORS COMPANY

3. Remove the piston dust boot seal (1) from the seal counter-bore in the caliper (4). Discard the boot seal.
4. Using a small wooden or plastic tool, remove the piston seal (4) from the caliper bore. Discard the piston seal.

Fig. 25: Brake Bleeder Valve

Courtesy of GENERAL MOTORS COMPANY

5. Remove the brake bleeder valve cap (2).
6. Remove the brake bleeder valve (1).

NOTE: Do not use abrasives to clean the brake caliper piston.

7. Inspect the caliper bore for cracks, scoring, pitting, excessive rust, and/or excessive corrosion.
8. Clean the brake caliper piston bore and seal counterbore, and the caliper piston with denatured alcohol, or equivalent.
9. Dry the caliper piston bore and counterbore, and the piston with non-lubricated, filtered, compressed air.
10. If light rust or light corrosion are present in the caliper bore, attempt to remove the imperfection with a fine emery paper. If the imperfection cannot be removed, replace the caliper assembly.
11. If cracks, scoring, pitting, excessive rust, and/or excessive corrosion are present in the caliper bore, replace the caliper assembly.
12. Inspect the caliper piston for cracks, scoring, and/or damage to the plating. Replace the caliper piston if any of these conditions exist.

Installation Procedure

Fig. 26: New Piston Seal

Courtesy of GENERAL MOTORS COMPANY

1. Lubricate the new piston seal (3) with the brake fluid from a clean, sealed brake fluid container. Refer to **Brake System Specifications** for the recommended brake fluid.
2. Install the lubricated, new piston seal (3) into the caliper bore.
3. Apply a thin coat of brake fluid from a clean, sealed brake fluid container onto the outer surface area of the caliper piston (2). Refer to **Brake System Specifications** for the recommended brake fluid
4. Install the bottom half of the caliper piston (2) into the caliper bore.

Fig. 27: Piston Dust Boot Seal And Over Caliper Piston
Courtesy of GENERAL MOTORS COMPANY

5. Install the new piston dust boot seal (1) over the caliper piston (2).
6. Compress the caliper piston (2) to the bottom of the caliper bore.
7. Fully seat the piston dust boot seal (1) into caliper counter-bore.

Fig. 28: Brake Bleeder Valve

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

8. Install the brake bleeder valve (1) to the caliper and tighten to 8.5 N.m (75 lb in).
9. Install the brake bleeder valve cap (1).
10. Install the brake caliper to the vehicle. Refer to Front Brake Caliper Replacement.

FRONT BRAKE CALIPER BRACKET REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Dust Warning .

Fig. 29: Brake Caliper With Heavy Mechanic's Wire
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

1. Remove the brake caliper from the brake caliper mounting bracket and support the brake caliper with heavy mechanic's wire (1), or equivalent. Do NOT disconnect the hydraulic brake flexible hose from the caliper. Refer to **Front Brake Caliper Replacement**.

Fig. 30: Brake Pads

Courtesy of GENERAL MOTORS COMPANY

2. Remove the brake pads (1) from the brake caliper bracket.
3. Remove the brake pad retainers (2) from the brake caliper bracket.
4. If reusing the bracket, thoroughly clean the pad hardware mating surfaces of the caliper bracket (3), of any debris and corrosion.
5. Inspect the disc brake pad retainers (2) for the following:
 - Bent mounting tabs
 - Excessive corrosion
 - Looseness at the brake caliper mounting bracket
 - Looseness at the disc brake pads
6. If any of the conditions listed are found, the disc brake pad retainers require replacement.

Fig. 31: Brake Caliper Mounting Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: The brake caliper mounting bracket bolts must not be used. Replace the bolts with new bolts whenever the bolts are removed or become loose.

7. Remove the brake caliper mounting bracket bolts (1).
8. Remove the brake caliper bracket from the steering knuckle.

Fig. 32: Brake Caliper Guide Pins

Courtesy of GENERAL MOTORS COMPANY

9. Inspect the caliper bracket. If the brake caliper bracket is bent, cracked, or damaged, it requires replacement.
10. Inspect the brake caliper guide pins (1) for freedom of movement, and inspect the condition of the guide pin boots (2). Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:
 - Restricted caliper guide pin movement
 - Looseness in the brake caliper mounting bracket
 - Seized or binding caliper guide pins
 - Split or torn boots
11. If any of the conditions listed are found, the brake caliper guide pins and/or boots require replacement.

Installation Procedure

Fig. 33: Brake Caliper Mounting Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the brake caliper mounting bracket to the steering knuckle.

CAUTION: Refer to Fastener Caution .

2. Install the 2 NEW brake caliper mounting bracket bolts (1) and tighten to 95 N.m (70 lb ft).

Fig. 34: Brake Pads

Courtesy of GENERAL MOTORS COMPANY

3. Apply a very thin coating of high temperature silicone brake lubricant to the pad hardware mating surfaces of the caliper bracket (3) only.
4. Clean the brake pad mating surfaces of the brake pad retainers (2).
5. Install the brake pad retainers (2) to the brake caliper bracket.

NOTE: The wear sensor equipped disc brake pad must be mounted inboard of the rotor with the leading edge of the sensor facing the brake rotor during forward wheel rotation, or at the top of the pad when installed in vehicle position.

6. Install the brake pads (1) to the brake caliper bracket.
7. Remove the support and reposition the brake caliper over the brake pads and to the mounting bracket. Refer to **Front Brake Caliper Replacement**.

FRONT BRAKE ROTOR REPLACEMENT

Special Tools

- CH-41013 Rotor Surfacing Kit

- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to **Brake Dust Warning** .

Removal Procedure

CAUTION: Refer to **Vehicle Lifting and Jacking Caution** .

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

Fig. 35: Brake Rotor Screw

Courtesy of GENERAL MOTORS COMPANY

3. Remove the brake rotor screw (1).

Fig. 36: C-clamp And Caliper Piston

Courtesy of GENERAL MOTORS COMPANY

4. Install a C-clamp over the body of the brake caliper, with the C-clamp ends against the rear of the caliper body and the outboard disc brake pad.
5. Tighten the C-clamp until the caliper piston is compressed into the caliper bore enough to allow the caliper to slide past the brake rotor.
6. Remove the C-clamp.

Fig. 37: Brake Rotor

Courtesy of GENERAL MOTORS COMPANY

7. Remove the brake caliper and the caliper mounting bracket as an assembly from the steering knuckle and support the assembly with heavy mechanics wire or equivalent. Ensure that there is no tension on the hydraulic brake flexible hose. Refer to **Front Brake Caliper Bracket Replacement**.
8. Remove the brake rotor (1) from the hub flange (2).

Installation Procedure

Fig. 38: Hub Flange

Courtesy of GENERAL MOTORS COMPANY

NOTE: Whenever the brake rotor has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in excessive assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.

1. Using the **CH-42450-A** wheel hub resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the hub flange (1).
2. Using the **CH-41013** rotor resurfacing kit, thoroughly clean any rust or corrosion from the mating surface and mounting surface of the brake rotor (2).
3. Inspect the mating surfaces of the hub/axle flange and the rotor to ensure that there are no foreign particles or debris remaining.

Fig. 39: Brake Rotor And Hub/Axle Flange
Courtesy of GENERAL MOTORS COMPANY

4. Install the brake rotor (1) to the hub/axle flange.

CAUTION: Refer to Fastener Caution .

5. Install the brake rotor screw (2) and tighten to 4 N.m (35 lb in).

Fig. 40: Brake Caliper Bracket Bolts

Courtesy of GENERAL MOTORS COMPANY

6. Remove the support, and install the brake caliper and the brake caliper bracket as an assembly to the steering knuckle and install the brake caliper bracket bolts (1). Refer to **Front Brake Caliper Bracket Replacement**.
7. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.
9. If the brake rotor was refinished or replaced, or if new brake pads were installed, burnish the pads and rotors. Refer to **Brake Pad and Rotor Burnishing**.

FRONT BRAKE SHIELD REPLACEMENT

Fig. 41: Front Brake Shield
 Courtesy of GENERAL MOTORS COMPANY

Front Brake Shield Replacement

Callout	Component Name
WARNING: Refer to <u>Brake Dust Warning</u> .	
Preliminary Procedures 1. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> 2. Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Without disconnecting the brake caliper hose, remove the brake caliper and bracket as an assembly and support with heavy mechanics wire or equivalent. Refer to <u>Front Brake Caliper Bracket Replacement</u>. 4. Remove the front brake rotor. Refer to <u>Front Brake Rotor Replacement</u>.	
1	Disc Brake Splash Shield Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 4 (35 lb in)
2	Disc Brake Splash Shield

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION

NOTE:

- Brake rotor thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Rotor Thickness Variation Measurement](#).
- Brake rotor assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4, 800-11, 300 km (3, 000-7, 000 mi). Refer to [Brake Rotor Assembled Lateral Runout Measurement](#).

Review the following acceptable methods for bringing the brake disc assembled LRO to within specifications. Determine which method to use for the vehicle being repaired.

- The indexing method of correcting assembled LRO is most effective when the LRO specification is only exceeded by a relatively small amount: 0.025-0.127 mm (0.001-0.005 in). Indexing is used to achieve the best possible match of high spots to low spots between related components. Refer to [Brake Rotor Assembled Lateral Runout Correction - Indexing](#).
- The on-vehicle brake lathe method is used to bring the LRO to within specifications through compensating for LRO while refinishing the brake rotor. Refer to [Brake Rotor Assembled Lateral Runout Correction - On Vehicle Lathe](#).

If the assembled LRO cannot be corrected using these methods, then other components must be suspected as causing and/or contributing to the LRO concern.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - INDEXING

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to [Special Tools](#).

WARNING: Refer to [Brake Dust Warning](#) .

Fig. 42: One Lug Nut & Conical Brake Rotor Washers
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Brake rotor thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.
- Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4, 800-11, 300 km (3, 000-7, 000 mi). Refer to Brake Rotor Assembled Lateral Runout Measurement.

1. Remove the **CH-45101-100** conical brake rotor washers and the lug nuts that were installed during the assembled LRO measurement procedure.
2. Inspect the mating surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
3. Index the brake rotor in a different orientation to the hub/axle flange.
4. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** conical brake rotor washers (1) and one lug nut (2) onto the upper-most wheel stud.
5. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

Fig. 43: Wheel Studs

Courtesy of GENERAL MOTORS COMPANY

6. Install the remaining **CH-45101-100** conical brake rotor washers and lug nuts onto the wheel studs (1) and tighten the nuts firmly by hand in the tightening sequence.
7. Tighten the lug nuts in sequence, in order to properly secure the rotor. Refer to **Tire and Wheel Removal and Installation**.
8. Measure the assembled LRO of the brake rotor. Refer to **Brake Rotor Assembled Lateral Runout Measurement**.
9. Compare the amount of change between this measurement and the original measurement.
10. If this measurement is within specifications, proceed to step 14.
11. If this measurement still exceeds specifications, repeat steps 1-9 until the best assembled LRO measurement is obtained.
12. Matchmark the final location of the rotor to the wheel studs if the orientation is different than it was originally.
13. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to **Brake Rotor Assembled Lateral Runout Correction**.
14. If the brake rotor assembled LRO is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** conical brake rotor washers and the lug nuts.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - ON VEHICLE LATHE

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to **Brake Dust Warning** .

NOTE:

- Brake rotor thickness variation **MUST** be checked before checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to **Brake Rotor Thickness Variation Measurement**.
- Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4, 800-11, 300 km (3, 000-7, 000 mi). Refer to **Brake Rotor Assembled Lateral Runout Measurement**.

1. Ensure that the brake caliper and brake caliper bracket that are already being supported, are clear from contacting any rotating components, such as the brake rotor.
2. Remove the **CH-45101-100** conical brake rotor washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
4. Set up the lathe, following the manufacturer instructions.
5. Refinish the brake rotor, following the brake lathe manufacturers instructions.
6. After each successive cut, inspect the brake rotor thickness. Refer to **Brake Rotor Thickness Measurement**.
7. If at any time the brake rotor exceeds the minimum allowable thickness after refinish specification, the brake rotor must be replaced. After replacing the brake rotor, proceed to step 10.
8. After refinishing the brake rotor, use the following procedure in order to obtain the desired non-directional finish:
 1. Follow the brake lathe manufacturer recommended speed setting for applying a non-directional finish.
 2. Using moderate pressure, apply the non-directional finish:
 - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
 - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.
 3. After applying a non-directional finish, clean each friction surface of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.

9. Remove the lathe from the vehicle.
10. Measure the assembled LRO of the brake rotor. Refer to **Brake Rotor Assembled Lateral Runout Measurement**.
11. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to **Brake Rotor Assembled Lateral Runout Correction**.
12. If the brake rotor assembled LRO is within specification, install the brake caliper and depress the brake pedal several times to secure the brake rotor in place before removing the **CH-45101-100** conical brake rotor washers and the lug nuts.

BRAKE ROTOR REFINISHING

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **The disc brake rotors do not require refinishing as part of routine brake system service. New disc brake rotors do not require refinishing.**

Do not refinish disc brake rotors in an attempt to correct the following conditions:

- **Brake system noise - squeal, growl, groan**
- **Uneven and/or premature brake pad wear**
- **Superficial or cosmetic corrosion/rust of the disc brake rotor friction surface**
- **Scoring of the disc brake rotor friction surface less than the maximum allowable specification**
- **Before refinishing a brake rotor, the brake rotor must first be checked for adequate thickness to allow the brake rotor to be refinished and remain above the minimum allowable thickness after refinish specification. Refer to [Brake Rotor Thickness Measurement](#).**

Disc brake rotors should only be refinished if they have adequate thickness to be refinished and if one or more of the following conditions exist:

- **Thickness variation in excess of the maximum allowable specification**
- **Excessive corrosion/rust and/or pitting**
- **Cracks and/or heat spots**

- Excessive blueing, discoloration
- Scoring of the disc brake rotor surface in excess of the maximum allowable specification
- Disc brake rotors may need to be refinished as part of the process for correcting brake rotor assembled lateral runout (LRO) that exceeds the maximum allowable specification.

NOTE: If the vehicle is equipped with cross-drilled rotors, use a lathe with positive rake tooling. This setup requires less cutting pressure, which will result in less vibration, and a better surface finish. Also, use a vibration dampener when cutting. Otherwise, refinish according to the following instructions.

NOTE: Whenever the brake rotor has been separated from the hub/axle flange, clean any rust or contaminants from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in increased assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.

1. Using the **CH-42450-A** wheel hub resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
2. Using the **CH-41013** rotor resurfacing kit, thoroughly clean any rust or corrosion from the mating surface and mounting surface of the brake rotor.
3. Inspect the mating surfaces of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
4. Mount the brake rotor to the brake lathe according to the lathe manufacturer's instructions, ensuring that all mounting attachments and adapters are clean and free of debris.
5. Ensure that any vibration dampening attachments are securely in place.
6. With the brake lathe running, slowly bring in the cutting tools until they just contact the brake rotor friction surfaces.
7. Observe the witness mark on the brake rotor. If the witness mark extends approximately three-quarters or more of the way around the brake rotor friction surface on each side, the brake rotor is correctly mounted to the lathe.
8. If the witness mark does not extend three-quarters or more of the way around the brake rotor, re-mount the brake rotor to the lathe.
9. Following the brake lathe manufacturer's instructions, refinish the brake rotor.
10. After each successive cut, inspect the brake rotor thickness. Refer to **Brake Rotor Thickness Measurement**.
11. If at any time the brake rotor exceeds the minimum allowable thickness after refinish specification, the brake rotor must be replaced.
12. After refinishing the brake rotor, use the following procedure in order to obtain the desired non-directional finish:
 1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional

finish.

2. Using moderate pressure, apply the non-directional finish:
 - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
 - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.
3. After applying a non-directional finish, clean each friction surface of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner and wipe each friction surface using a clean shop towel to remove metal particles remaining from machining. Repeat the cleaning process if necessary to remove all metal particles.
13. Remove the brake rotor from the brake lathe.
14. Measure the assembled LRO of the brake rotor to ensure optimum performance of the disc brakes. Refer to **Brake Rotor Assembled Lateral Runout Measurement**.
15. If the brake rotor assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to **Brake Rotor Assembled Lateral Runout Correction**.

DESCRIPTION AND OPERATION

DISC BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The disc brake system consists of the following components:

Disc Brake Pads

Applies mechanical output force from the hydraulic brake calipers to friction surfaces of brake rotors.

Disc Brake Rotors

Uses mechanical output force applied to friction surfaces from the disc brake pads to slow speed of tire and wheel assembly rotation.

Disc Brake Pad Hardware

Secures disc brake pads firmly in proper relationship to the hydraulic brake calipers. Enables a sliding motion of brake pads when mechanical output force is applied.

Disc Brake Caliper Hardware

Provides mounting for hydraulic brake caliper and secures the caliper firmly in proper relationship to caliper bracket. Enables a sliding motion of the brake caliper to the brake pads when mechanical output force is applied.

System Operation

Mechanical output force is applied from the hydraulic brake caliper pistons to the inner brake pads. As the pistons press the inner brake pads outward, the caliper housings draw the outer brake pads inward. This allows the output force to be equally distributed. The brake pads apply the output force to the friction surfaces on both sides of the brake rotors, which slows the rotation of the tire and wheel assemblies. The correct function of both the brake pad and brake caliper hardware is essential for even distribution of braking force.

DIAGNOSTIC INFORMATION AND PROCEDURES

BRAKE DRUM DIAMETER MEASUREMENT

Fig. 1: Drum Brake Micrometer
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Dust Warning .

1. Clean the brake shoe lining contact surface of the brake drum with denatured alcohol or an equivalent approved brake cleaner.
2. Using a brake drum micrometer calibrated in thousandths-of-an-inch, measure and record the largest diameter of the brake drum at four or more points, equally spaced around the drum.

Ensure the measurements are only taken within the brake shoe lining contact area. The micrometer must be positioned the same distance from the outside edge of the drum for each measurement.

3. Compare the largest diameter measurement recorded to the following specifications:

Specification

- Brake drum maximum allowable diameter after refinishing: 200.75 mm (7.904 in)
 - Brake drum discard diameter: 201.00 mm (7.91 in)
4. If the largest diameter measurement of the brake drum is less than the maximum allowable inside

diameter after refinishing specification, the drum may be refinished, depending upon surface and wear conditions.

5. If the largest diameter measurement of the brake drum is equal to or greater than the maximum allowable diameter after refinishing specification, the drum may not be refinished.
6. If the largest diameter measurement of the brake drum is equal to or greater than the discard diameter specification, the drum requires replacement.

BRAKE DRUM SURFACE AND WEAR INSPECTION

Special Tools

CH-8001 Dial Indicator Set

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to Brake Dust Warning .

1. With the brake drum removed, clean the brake shoe lining contact surface of the brake drum with denatured alcohol or an equivalent approved brake cleaner.

2. Inspect the braking surface of the brake drum for the following braking surface conditions:

- Heavy rust and/or pitting

Light surface rust can be removed with an abrasive disc; heavy surface rust and/or pitting must be removed by refinishing the drum.

- Cracks and/or heat spots
- Excessive blueing discoloration
- Missing balance weights

3. If the braking surface of the brake drum exhibits one or more of the braking surface conditions listed, the drum requires refinishing or replacement.

Fig. 2: Drum Brake Micrometer

Courtesy of GENERAL MOTORS COMPANY

4. Using a brake drum micrometer calibrated in thousandths-of-an-inch, measure and record any grooves present on the drum braking surface.

Ensure that the measurements are only taken within the brake shoe lining contact area.

5. Compare the groove, or scoring depth recorded to the following specification:

Specification

Brake drum maximum allowable scoring: 0.50 mm (0.020 in)

6. If the brake drum scoring depth exceeds the specification, or if an excessive amount of scoring is present, the drum requires refinishing or replacement.
7. Mount the brake drum on a brake lathe.

Fig. 3: Dial Indicator And Brake Drum

Courtesy of GENERAL MOTORS COMPANY

8. Mount a dial indicator, **CH-8001** indicator (1), or equivalent, and position the indicator button so it contacts the braking surface of the brake drum (2) at a 90 degree angle, approximately 19 mm (0.75 in) from the outer edge of the drum.
9. Measure and record the radial runout of the brake drum.
 1. Rotate the drum until the lowest reading is displayed on the indicator dial, then zero the dial.
 2. Rotate the drum until the highest reading is displayed on the dial.
10. Compare the radial runout of the brake drum to the following specification:

Specification

Brake drum maximum allowable radial runout: 0.03 mm (0.001 in)

11. If the brake drum radial runout exceeds the specification, the drum requires refinishing or replacement.

DRUM BRAKE HARDWARE INSPECTION

Fig. 4: Drum Brake Hardware
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Dust Warning .

1. Visually inspect the drum brake upper return spring (1) for the following conditions:
 - Excessive corrosion
 - Excessive stretching
 - Broken
 - Missing
2. If any of the conditions listed were found, the drum brake upper return spring requires replacement.
3. Visually inspect the park brake apply lever (2) for the following conditions:
 - Bent
 - Broken
 - Missing
4. If any of the conditions listed were found, the park brake shoes require replacement.
5. Visually inspect the drum brake shoe hold down springs and cups (3) and pins for the following conditions:

- Excessive corrosion
 - Broken
 - Missing
 - Bent pins
6. If any of the conditions listed were found, the hold down springs, cups, and pins require replacement.
 7. Visually inspect the drum brake lower return spring (4) for the following conditions:
 - Excessive corrosion
 - Excessive stretching
 - Broken
 - Missing
 8. If any of the conditions listed were found, the drum brake lower spring requires replacement.

DRUM BRAKE ADJUSTING HARDWARE INSPECTION

Fig. 5: Drum Brake Adjusting Hardware
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Dust Warning .

1. Visually inspect the adjuster actuator spring (1) for the following conditions:
 - Excessive stretching
 - Excessive bending
 - Excessive corrosion
 - Broken
 - Missing
2. If any of the conditions listed were found, the adjuster actuator spring requires replacement.
3. Visually inspect the adjuster actuator lever (2) for the following conditions:
 - Bent
 - Broken
 - The lever engagement surface excessively worn
 - Excessively bent or broken spring attachment tab
 - Missing
4. If any of the conditions listed were found, the adjuster actuator lever requires replacement.
5. Visually inspect the adjuster assembly (3) for the following conditions:
 - Bent
 - Broken
 - Seized adjuster wheel threads
 - Excessively worn, damaged, or missing teeth
6. If any of the conditions listed were found, the adjuster assembly requires replacement.

REPAIR INSTRUCTIONS

BRAKE DRUM REPLACEMENT

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

WARNING: Refer to **Brake Dust Warning** .

1. Check to ensure that the park brake is fully released.
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

Fig. 6: Brake Drum Screw

Courtesy of GENERAL MOTORS COMPANY

4. Remove the brake drum screw (1).
5. Remove the brake drum (2).
6. If reinstalling the brake drum, use the **CH-41013** rotor resurfacing kit to clean the wheel hub flange mating surface of the brake drum of any corrosion.

Installation Procedure

1. Using the **CH-42450-A** wheel hub resurfacing kit to clean the wheel hub flange of any corrosion.

Fig. 7: Brake Drum Screw

Courtesy of GENERAL MOTORS COMPANY

2. Install the brake drum (2).
3. Adjust the drum brakes. Refer to **Drum Brake Adjustment**.

CAUTION: Refer to **Fastener Caution** .

4. Install the brake drum screw (1) and tighten to 4 N.m (35 lb in).
5. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
6. Apply the brakes 2 or 3 times to seat and center the brake shoes on the brake drum.

BRAKE DRUM REFINISHING

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to Brake Dust Warning .

1. The brake drums do not require refinishing as part of routine brake system service. Do not refinish brake drums in an attempt to correct the following conditions:
 - Brake system noise (squeal, growl, groan)
 - Uneven and/or premature brake lining wear
 - Superficial or cosmetic corrosion/rust of the brake drum surface
 - Scoring of the brake drum surface (less than the maximum allowable specification)
2. Brake drums should only be refinished if the following conditions exist:
 - Excessive corrosion/rust and/or pitting
 - Cracks and/or heat spots
 - Excessive blueing discoloration
 - Scoring of the brake drum surface (in excess of the maximum allowable specification)
 - Radial runout in excess of the maximum allowable specification
3. Inspect each of the brake drums and determine if the brake drums can be refinished and remain within the maximum allowable diameter after refinish specification:
 1. With the tire and wheel assemblies removed, measure the diameter of each of the brake drums. Refer to **Brake Drum Diameter Measurement**.
 2. Inspect each of the brake drums for excessive surface wear and/or radial runout. Refer to **Brake Drum Surface and Wear Inspection**.
4. If the brake drums can be refinished, proceed with the rotor refinishing procedure.
5. If necessary, use the **CH-41013** rotor resurfacing kit in order to thoroughly clean any corrosion/rust from the brake drum flange.
6. Mount the brake drum to the brake lathe according to the lathe manufacturer instructions.
7. Ensure that any vibration dampening attachments are securely in place.
8. With the brake lathe running, slowly bring in the cutting tool until it just contacts the brake drum friction surface.
9. Observe the witness mark on the brake drum. If the witness mark extends approximately three-quarters or more of the way around the brake drum surface, the brake drum is properly mounted to the lathe.
10. If the witness mark does not extend three-quarters or more of the way around the brake drum, re-mount the brake drum to the lathe.
11. Following the brake lathe manufacturer instructions, refinish the brake drum.
12. After each successive cut, inspect the brake drum diameter. Refer to **Brake Drum Diameter Measurement**.
13. If at any time the brake drum exceeds the maximum allowable diameter after refinish specification, the brake drum must be replaced.
14. After refinishing the brake drum, use the following procedure in order to obtain the desired non-directional finish:
 1. Follow the brake lathe manufacturer's recommended speed setting for applying non-directional

finish.

2. Using the moderate pressure, apply the non-directional finish:
 - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
 - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.
 3. After applying a non-directional finish, clean the friction surface of the brake drum with denatured alcohol or an equivalent brake cleaner and wipe the friction surface using a clean shop towel to remove metal particles remaining from machining. Repeat the cleaning process if necessary to remove all metal particles.
15. Remove the brake drum from the brake lathe.
 16. If necessary, use the **CH-42450-A** wheel hub resurfacing kit in order to thoroughly clean any corrosion from the wheel bearing flange.

BRAKE SHOE REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Dust Warning .

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .
3. Remove the brake drum. Refer to Brake Drum Replacement.

Fig. 8: Spring Fastener And Upper Brake Shoe Return Spring
Courtesy of GENERAL MOTORS COMPANY

4. Remove the spring fastener (1) and upper brake shoe return spring (2).

Fig. 9: Brake Adjuster Actuator Lever Spring
Courtesy of GENERAL MOTORS COMPANY

5. Remove brake adjuster actuator lever spring (1).

Fig. 10: Brake Adjuster Actuator Lever

6. Remove the brake adjuster actuator lever (1).

Fig. 11: Brake Shoe Adjuster

Courtesy of GENERAL MOTORS COMPANY

7. Spread the top of the brake shoes apart slightly and remove the brake shoe adjuster (1).

Fig. 12: Cup Assemblies

Courtesy of GENERAL MOTORS COMPANY

8. Remove the brake shoe hold down spring and cup assemblies (1) by compressing the spring and rotating the assembly 1/4 turn.
9. Remove the 2 hold-down spring and cup assembly pins.

Fig. 13: Primary Brake Shoe

Courtesy of GENERAL MOTORS COMPANY

10. Rotate the primary brake shoe (1) toward the wheel hub assembly and release the brake shoe from the lower brake shoe return spring.

Fig. 14: Lower Brake Shoe Return Spring
Courtesy of GENERAL MOTORS COMPANY

11. Remove the lower brake shoe return spring (1).
12. Inspect the drum brake hardware and replace any components, as necessary. Refer to **Drum Brake Hardware Inspection**.

Fig. 15: Brake Shoe

Courtesy of GENERAL MOTORS COMPANY

13. Compress the park brake cable return spring and release the park brake cable fitting from the park brake apply lever and remove the brake shoe (1).

Installation Procedure

1. Clean the drum brake backing plate of any dirt and debris.
2. Apply a light coat of high temperature brake lubricant to the brake drum backing plate shoe contact surfaces.

Fig. 16: Brake Shoe

Courtesy of GENERAL MOTORS COMPANY

3. Compress the park brake cable return spring and install the park brake cable fitting to the park brake apply lever and position the brake shoe (1) to the drum brake backing plate.

Fig. 17: Lower Brake Shoe Return Spring
Courtesy of GENERAL MOTORS COMPANY

4. Install the lower brake shoe return spring (1).

Fig. 18: Primary Brake Shoe

Courtesy of GENERAL MOTORS COMPANY

5. Position the primary brake shoe (1) to the brake drum backing plate and connect the brake shoe to the lower brake shoe return spring.

Fig. 19: Cup Assemblies

Courtesy of GENERAL MOTORS COMPANY

6. Install the 2 hold-down spring and cup assembly pins.
7. Install the brake shoe hold down spring and cup assemblies (1) by compressing the spring and rotating the assembly 1/4 turn.

Fig. 20: Brake Shoe Adjuster

Courtesy of GENERAL MOTORS COMPANY

8. Spread the top of the brake shoes apart slightly and install the brake shoe adjuster (1).

Fig. 21: Brake Adjuster Actuator Lever
Courtesy of GENERAL MOTORS COMPANY

9. Install the brake adjuster actuator lever (1).

Fig. 22: Brake Adjuster Actuator Lever Spring
Courtesy of GENERAL MOTORS COMPANY

10. Install the brake adjuster actuator lever spring (1).

Fig. 23: Spring Fastener And Upper Brake Shoe Return Spring
Courtesy of GENERAL MOTORS COMPANY

11. Install the spring fastener (1) and upper brake shoe return spring (2).
12. Adjust the drum brakes. Refer to **Drum Brake Adjustment**.
13. Install the brake drum. Refer to **Brake Drum Replacement**.
14. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**.
15. Lower the vehicle.

REAR BRAKE BACKING PLATE REPLACEMENT

Removal Procedure

WARNING: Refer to **Brake Dust Warning** .

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the brake drum. Refer to **Brake Drum Replacement**.
4. Remove the rear wheel speed sensor, if equipped. Refer to **Rear Wheel Speed Sensor Replacement** .

5. Remove the brake shoes. Refer to **Brake Shoe Replacement**.
6. Remove the wheel cylinder. Refer to **Rear Brake Cylinder Replacement**.

Fig. 24: Rear Park Brake Cable Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

7. Remove the park brake cable retaining clip (1) from the drum brake backing plate.

Fig. 25: Rear Brake Backing Plate
Courtesy of GENERAL MOTORS COMPANY

8. Remove the rear wheel bearing and hub assembly. Refer to **Rear Wheel Bearing and Hub Replacement** .
9. Remove the rear brake backing plate (1) from the rear axle assembly.

Installation Procedure

Fig. 26: Rear Brake Backing Plate
Courtesy of GENERAL MOTORS COMPANY

1. Install the rear brake backing plate (1) to the rear axle assembly.
2. Install the rear wheel bearing and hub assembly. Refer to **Rear Wheel Bearing and Hub Replacement** .
3. Install the wheel cylinder. Refer to **Rear Brake Cylinder Replacement**.
4. Install the brake shoes. Refer to **Brake Shoe Replacement**.

Fig. 27: Rear Park Brake Cable Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

5. Install the park brake cable retaining clip (1) to the drum brake backing plate.
6. Install the rear wheel speed sensor, if equipped. Refer to **Rear Wheel Speed Sensor Replacement** .
7. Adjust the drum brakes. Refer to **Drum Brake Adjustment**.
8. Install the brake drum. Refer to **Brake Drum Replacement**.
9. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** , **Hydraulic Brake System Bleeding (Pressure)** .
10. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
11. Lower the vehicle.

DRUM BRAKE HARDWARE REPLACEMENT

Removal Procedure

WARNING: Refer to **Brake Dust Warning** .

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the brake drum. Refer to **Brake Drum Replacement**.

Fig. 28: Spring Fastener And Upper Brake Shoe Return Spring
Courtesy of GENERAL MOTORS COMPANY

4. Remove the spring fastener (1) and upper brake shoe return spring (2).

8. Install the spring fastener (1) and upper brake shoe return spring (2).
9. Adjust the drum brakes. Refer to **Drum Brake Adjustment**.
10. Install the brake drum. Refer to **Brake Drum Replacement**.
11. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**.
12. Lower the vehicle.

DRUM BRAKE ADJUSTING HARDWARE REPLACEMENT

Removal Procedure

WARNING: Refer to **Brake Dust Warning** .

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the brake drum. Refer to **Brake Drum Replacement**.

Fig. 42: Spring Fastener And Upper Brake Shoe Return Spring
Courtesy of GENERAL MOTORS COMPANY

4. Remove the spring fastener (1) and upper brake shoe return spring (2).

Fig. 43: Brake Adjuster Actuator Lever Spring
Courtesy of GENERAL MOTORS COMPANY

5. Remove brake adjuster actuator lever spring (1).

Fig. 44: Brake Adjuster Actuator Lever
Courtesy of GENERAL MOTORS COMPANY

6. Remove the brake adjuster actuator lever (1).

Fig. 45: Brake Shoe Adjuster

Courtesy of GENERAL MOTORS COMPANY

7. Spread the top of the brake shoes apart slightly and remove the brake shoe adjuster (1).
8. Inspect the drum brake adjusting hardware and replace any damaged components as necessary. Refer to **Drum Brake Adjusting Hardware Inspection.**
9. Disassemble the brake shoe adjuster and thoroughly clean the adjuster screw threads of any corrosion.

Installation Procedure

Fig. 46: Brake Shoe Adjuster

Courtesy of GENERAL MOTORS COMPANY

1. Apply a light coat of high temperature brake lubricant to the brake shoe adjuster screw threads.
2. Assemble the brake shoe adjuster, setting the adjuster to the fully retracted position.
3. Spread the top of the brake shoes apart slightly and install the brake shoe adjuster (1).

Fig. 47: Brake Adjuster Actuator Lever
Courtesy of GENERAL MOTORS COMPANY

4. Install the brake adjuster actuator lever (1).

Fig. 48: Brake Adjuster Actuator Lever Spring
Courtesy of GENERAL MOTORS COMPANY

5. Install the brake adjuster actuator lever spring (1).

Fig. 49: Spring Fastener And Upper Brake Shoe Return Spring
Courtesy of GENERAL MOTORS COMPANY

6. Install the spring fastener (1) and upper brake shoe return spring (2).
7. Adjust the drum brakes. Refer to **Drum Brake Adjustment**.
8. Install the brake drum. Refer to **Brake Drum Replacement**.
9. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**.
10. Lower the vehicle.

REAR BRAKE CYLINDER REPLACEMENT

Removal Procedure

WARNING: Refer to **Brake Dust Warning** .

WARNING: Refer to **Brake Fluid Irritant Warning** .

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

2. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the brake drum. Refer to **Brake Drum Replacement**.
4. Remove the drum brake adjusting hardware. Refer to **Drum Brake Adjusting Hardware Replacement**.
5. Clean the area surrounding the wheel cylinder of dirt and debris.
6. Remove the wheel cylinder bleeder valve to get tool access to the brake pipe fitting.

Fig. 50: Wheel Cylinder Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

7. Disconnect the wheel cylinder brake pipe fitting (1).

Cap the brake pipe fitting to prevent brake fluid loss and contamination.

Fig. 51: Wheel Cylinder Bolts

Courtesy of GENERAL MOTORS COMPANY

8. Remove the wheel cylinder bolts (1).

Fig. 52: Wheel Cylinder

Courtesy of GENERAL MOTORS COMPANY

9. Spread the top of the brake shoes slightly and remove the wheel cylinder (1) from the backing plate.

Installation Procedure

Fig. 53: Wheel Cylinder

Courtesy of GENERAL MOTORS COMPANY

1. Spread the top of the brake shoes slightly and install the wheel cylinder (1) to the backing plate.

Fig. 54: Wheel Cylinder Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the wheel cylinder bolt (1) and tighten to 10 N.m (89 lb in).
3. Install the wheel cylinder bleeder valve and tighten to 8.5 N.m (75 lb in).

Fig. 55: Wheel Cylinder Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

4. Install the wheel cylinder brake pipe fitting (1) to the wheel cylinder and tighten to 18 N.m (13 lb ft).
5. Install the drum brake adjusting hardware. Refer to **Drum Brake Adjusting Hardware Replacement**.
6. Adjust the drum brakes. Refer to **Drum Brake Adjustment**.
7. Install the brake drum. Refer to **Brake Drum Replacement**.
8. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**.
9. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** , **Hydraulic Brake System Bleeding (Pressure)** .
10. Lower the vehicle.

DRUM BRAKE ADJUSTMENT

Special Tools

CH-21177-A Drum to Brake Shoe Clearance Gauge

For equivalent regional tools, refer to **Special Tools**.

WARNING: Refer to **Brake Dust Warning** .

NOTE: Use **ONLY HAND TOOLS** when loosening or tightening the adjusting nut.

1. Ensure the park brake lever is in the fully released position.
2. Release the park brake lever boot from the floor console by applying light pressure inward on the sides of the boot retainer.

Fig. 56: Front Park Brake Cable Adjusting Nut
Courtesy of GENERAL MOTORS COMPANY

3. Pull the boot away from the console to expose the front park brake cable adjusting nut (1).
4. Release the tension from the park brake cable system at the front cable adjusting nut.

Using **ONLY HAND TOOLS**, loosen the adjusting nut (1) completely to the end of the front cable threaded rod.

5. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
6. Remove the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
7. Remove the brake drums. Refer to **Brake Drum Replacement**.

Fig. 57: Position CH-21177-A Gauge
Courtesy of GENERAL MOTORS COMPANY

8. Position the **CH-21177-A** gauge to the widest point of the brake drum inside diameter.
9. Firmly hand tighten the set screw on the **CH-21177-A** gauge.

Fig. 58: Remove CH-21177-A Gauge
Courtesy of GENERAL MOTORS COMPANY

10. Remove the **CH-21177-A** gauge from the brake drum and position it over the corresponding brake shoe assembly at its widest point.
11. While holding the **CH-21177-A** gauge drum to brake shoe clearance gauge in position, insert a proper feeler gauge between one side of the **CH-21177-A** drum to brake shoe clearance gauge drum to brake shoe clearance gauge, and the corresponding brake shoe lining.
12. Rotate the brake shoe adjuster screw until the brake shoe linings contact the **CH-21177-A** gauge and the feeler gauge.

Specification

Brake shoe lining-to-drum clearance: 0.4-1.09 mm (0.016-0.043 in)

13. Repeat the above steps for the opposite brake drum and brake shoe assembly.
14. Install the brake drums. Refer to **Brake Drum Replacement**.
15. Adjust the park brake. Refer to **Parking Brake Adjustment**.
16. Install the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation**.
17. Lower the vehicle.
18. Position the park brake lever boot to the floor console and press the boot retainer into place to secure.

DESCRIPTION AND OPERATION

DRUM BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The drum brake system consists of the following:

Drum Brake Shoes

Applies mechanical output force, from hydraulic brake wheel cylinders, to friction surfaces of brake drums.

Brake Drums

Uses mechanical output force applied to friction surface from drum brake shoes to slow speed of tire and wheel assembly rotation.

Brake Drum Hardware

Secures drum brake shoes firmly in proper relationship to hydraulic brake wheel cylinders. Enables sliding motion of brake shoes needed to expand toward friction surface of drums when mechanical output force is applied. Provides return of brake shoes when mechanical output force is relieved.

Brake Drum Adjusting Hardware

Provides automatic adjustments of brake shoes to brake drum friction surface whenever brake apply occurs.

System Operation

Mechanical output force is applied from the hydraulic brake wheel cylinder pistons to the top of the drum brake shoes. The output force is then distributed between the primary and secondary brake shoes as the shoes expand toward the friction surface of the brake drums. The brake shoes apply the output force to the friction surface of the brake drums, which slows the rotation of the tire and wheel assemblies. The proper friction of both the drum brake hardware and adjusting hardware is essential to the proper distribution of braking force.

ENGINE COOLING SYSTEM - DIAGNOSTIC TROUBLE CODES

ENGINE COOLING SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC P00B3 or P00B4</u>	Radiator Coolant Temperature (RCT) Sensor
<u>DTC P00B7</u>	Radiator Coolant Temperature (RCT) Insufficient Flow
<u>DTC P0480, P0481, P0691, P0692, P0693 or P0694</u>	Cooling Fan Relay
<u>DTC P0597-P0599</u>	Engine Coolant Thermostat Heater
<u>DTC P112F</u>	Radiator Coolant Temperature Sensor
<u>DTC P2181</u>	Engine Cooling System Performance

FIXED AND MOVEABLE WINDOWS - DIAGNOSTIC TROUBLE CODES

FIXED AND MOVEABLE WINDOWS - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC B0283</u>	Rear Defrost Circuit
<u>DTC B0969</u>	Rear Defog Indicator

HORN SYSTEM - DIAGNOSTIC TROUBLE CODES

HORN SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC B2750</u>	Horn Relay

HVAC SYSTEM - MANUAL - DIAGNOSTIC TROUBLE CODES

HVAC SYSTEM - MANUAL - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC B3933</u>	Evaporator Temperature Sensor
<u>DTC B393D</u>	Air Conditioning Indicator Circuit
<u>DTC P0532 or P0533</u>	Air Conditioning (A/C) Refrigerant Pressure Sensor
<u>DTC P0645, P0646, or P0647</u>	Air Conditioning (A/C) Compressor Clutch Relay

HYDRAULIC BRAKE SYSTEM - DIAGNOSTIC TROUBLE CODES

HYDRAULIC BRAKE SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC C0267</u>	Low Brake Fluid

IMMOBILIZER SYSTEM - DIAGNOSTIC TROUBLE CODES

IMMOBILIZER SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC B2955</u>	Security Sensor
<u>DTC B302A</u>	Mobile Telephone Communications Interface
<u>DTC B3031</u>	Security Controller In Learn Mode
<u>DTC B3055</u>	No Transponder Modulation
<u>DTC B305C</u>	Immobilizer Transponder of Wrong Type Programmed
<u>DTC B3060</u>	Unprogrammed Transponder Identification Code Received
<u>DTC B389A</u>	Environment Identification
<u>DTC B3902</u>	Incorrect Immobilizer Identifier Received
<u>DTC B3935</u>	Transponder Authentication
<u>DTC B3976</u>	Unconfigured Transponder
<u>DTC B3984</u>	Device 1 Environment Identification
<u>DTC P0513</u>	Immobilizer Key Incorrect
<u>DTC P0633</u>	Immobilizer Key Not Programmed
<u>DTC P162B</u>	Remote Vehicle Speed Limiting Signal Message Counter
<u>DTC P1631</u>	Immobilizer Fuel Enable Signal
<u>DTC P1649</u>	Immobilizer Security Code Not Programmed

INSTRUMENT PANEL SYSTEM DISPLAYS AND GAUGES - DIAGNOSTIC TROUBLE CODES

INSTRUMENT PANEL SYSTEM DISPLAYS AND GAUGES - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC B0158</u>	Outside Air Temperature Display Malfunction
<u>DTC B0550</u>	Odometer Circuit General Memory
<u>DTC B1370</u>	Control Module Ignition On and Start Circuit
<u>DTC P0461-P0464</u>	Fuel Gauge Malfunction
<u>DTC P0520</u>	Engine Oil Pressure Switch
<u>DTC P0521</u>	Engine Oil Pressure Sensor

KEYLESS ENTRY SYSTEM AND REMOTE FUNCTIONS - DIAGNOSTIC TROUBLE CODES

KEYLESS ENTRY SYSTEM AND REMOTE FUNCTIONS - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC B3101</u>	Keyless Entry Data Link
<u>DTC B3105</u>	Keyless Entry Transmitters
<u>DTC B3106</u>	Keyless Entry Data Link
<u>DTC B3109-B3113</u>	Keyless Entry Transmitter 1-5 Battery
<u>DTC B310D-B310F</u>	Keyless Entry Transmitter 6-8 Battery

LIGHTING SYSTEM - DIAGNOSTIC TROUBLE CODES

LIGHTING SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
<u>DTC B1395</u>	Control Module Voltage Reference
<u>DTC B1480</u>	Battery Rundown Protection Circuit
<u>DTC B2530</u>	Front Fog Lamps Control Circuit
<u>DTC B2545</u>	Backup Lamps Circuit
<u>DTC B2570</u>	Trunk Lamp Control Circuit
<u>DTC B2575 or B2699</u>	Headlamps Control Circuit
<u>DTC B257A</u>	Headlamp Switch Input Signals
<u>DTC B2580</u>	Headlamp High Beam Control Circuit
<u>DTC B2585 or B3867</u>	Park Lamps Control Circuit
<u>DTC B2610</u>	Passenger Compartment Dimming 1
<u>DTC B2615</u>	Passenger Compartment Dimming
<u>DTC B2625</u>	Display Dimming Pulse Width Modulation
<u>DTC B2652</u>	Passenger Compartment Dimming 3
<u>DTC B3596</u>	Hazard Lamps Request

<u>DTC B3600</u>	Passenger Compartment Dimming Request Signal
<u>DTC B3650</u>	High Beam Request Signal
<u>DTC B3806</u>	High Beam and Headlamp Flash Select
<u>DTC B3881 or B3882</u>	Tail Lamp Circuit
<u>DTC B3883</u>	License Plate Lamp Circuit
<u>DTC B3884</u>	Center High Mounted Brake Lamp
<u>DTC B3948 or B3949</u>	Front Turn Signal Circuit
<u>DTC B3950 or B3951</u>	Rear Turn Signal Circuit
<u>DTC C0277 or C0890</u>	Brake Pedal Position Sensor
<u>DTC C0297</u>	Brake Applied Output Circuit

MANUAL TRANSMISSION - Y4A/Y4M - DIAGNOSTIC TROUBLE CODES

MANUAL TRANSMISSION - Y4A/Y4M - DIAGNOSTIC TROUBLE CODES

<u>DTC</u>	<u>Description</u>
<u>DTC P0501</u>	Vehicle Speed Sensor
<u>DTC P0502 or P0503</u>	Vehicle Speed Sensor
<u>DTC P0502 or P0503</u>	Vehicle Speed Sensor (LL0 Engine)
<u>DTC P0806-P0808</u>	Clutch Pedal Position (CPP) Sensor (LL0 Engine)
<u>DTC P0806-P0808</u>	Clutch Pedal Position (CPP) Sensor (LMT)
<u>DTC P080A</u>	Clutch Pedal Position (CPP) Sensor
<u>DTC P0812</u>	Reverse Position Switch
<u>DTC P0812</u>	Reverse Position Switch (LL0 Engine)

POWER DOOR LOCK SYSTEM AND RELEASE SYSTEMS - DIAGNOSTIC TROUBLE CODES

POWER DOOR LOCK SYSTEM AND RELEASE SYSTEMS - DIAGNOSTIC TROUBLE CODES

<u>DTC</u>	<u>Description</u>
<u>DTC B3125, B3130 or B3135</u>	Driver Door Only Unlock/All Doors Lock And Unlock (With AU3)

ENGINE PERFORMANCE

Engine Controls and Fuel - 1.0L, 1.19L or 1.2L - Repair Instructions - Spark

REPAIR INSTRUCTIONS

BRAKE PEDAL POSITION SENSOR LEARN

Calibration Criteria

NOTE: Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.

Brake pedal position sensor calibration must be performed after the brake pedal position sensor, body control module (BCM) or engine control module (ECM) have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM and ECM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

Calibration Procedure

1. Apply the parking brake.
2. Ignition ON, engine OFF, place the transmission in the PARK position for automatic transmission or NEUTRAL position for manual transmission.
3. Install a scan tool.
4. Clear all DTCs before proceeding.
5. Navigate to the Configuration/Reset Functions menu of the BCM.
6. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.
7. Navigate to the Configuration/Reset Functions menu of the ECM.
8. Select the Learn Functions menu.
9. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.

ENGINE CONTROL MODULE REPLACEMENT

Pre-Removal Procedure

- CAUTION:**
- Turn the ignition OFF when installing or removing the control module connectors and disconnecting or reconnecting the power to the control module (battery cable, powertrain control module (PCM)/engine control module (ECM)/transaxle control module (TCM) pigtail, control module fuse, jumper cables, etc.) in order to prevent internal control module damage.
 - Control module damage may result when the metal case contacts

battery voltage. DO NOT contact the control module metal case with battery voltage when servicing a control module, using battery booster cables or when charging the vehicle battery.

- In order to prevent any possible electrostatic discharge damage to the control module, do not touch the connector pins or the soldered components on the circuit board.
- Remove any debris from around the control module connector surfaces before servicing the control module. Inspect the control module connector gaskets when diagnosing or replacing the control module. Ensure that the gaskets are installed correctly. The gaskets prevent contaminant intrusion into the control module.
- The replacement control module must be programmed.

Removal Procedure

WARNING: Unless directed otherwise, the ignition and start switch must be in the OFF or LOCK position and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

For Vehicles equipped with OnStar® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar® module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStar® Back-Up Battery system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

Fig. 1: Engine Control Module (Ecm) Bracket Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Turn the ignition OFF.
2. Remove the battery. Refer to **Battery Replacement** .

Fig. 2: ECM Retaining Nut

Courtesy of GENERAL MOTORS COMPANY

3. Remove the engine control module (ECM) bracket retaining bolt (2).
4. Release the ECM connector locking lever and disconnect the ECM connector.
5. Remove the ECM retaining nut (3) from the ECM bracket (1) and remove the ECM.

Installation Procedure

Fig. 3: ECM Retaining Nut

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the ECM retaining nut (3) and tighten to 10 (89 lb in).

NOTE: **Connect the front electrical connector to the ECM first.**

2. Connect the ECM connector and lock the ECM connector locking lever.
3. Install the ECM bracket (1) to the battery tray and tighten the ECM bracket retaining bolt (2) to 10 (89 lb in).
4. Install the battery. Refer to Battery Replacement .

Q38 THROTTLE BODY: THROTTLE/IDLE LEARN

Description

The engine control module (ECM) learns the airflow through the throttle body to ensure the correct idle. The learned airflow values are stored within the ECM. These values are learned to adjust for production variation

and will continuously learn during the life of the vehicle to compensate for reduced airflow due to throttle body coking. Anytime the throttle body airflow rate changes, for example due to cleaning or replacing, the values must be relearned.

An engine that had a heavily coked throttle body that has been cleaned or replaced may take several drive cycles to unlearn the coking. To accelerate the process, the scan tool has the ability to reset all learned values back to zero. A new ECM will also have values set to zero.

The idle may be unstable or a DTC may set if the learned values do not match the actual airflow.

Conditions for Running the Throttle Learn Procedure

Scan tool Idle Learn or Idle Learn Reset Procedure

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0120, P0122, P0123, P0128, P0171, P0172, P0174, P0175, P0201-P0208, P0220, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0279, P0280, P0282, P0283, P0300-P0308, P0351-P0358, P0496, P0601, P0604, P0606, P060D, P0641, P0651, P1516, P2101, P2119, P2120, P2122, P2123, P2125, P2127, P2128, P2135, P2138 or P2176 are not set.
- Ignition ON, engine OFF.
- The vehicle speed sensor (VSS) is 0 km/h (0 mph).

Service Bay/On Road Learn Procedure

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0120, P0122, P0123, P0128, P0171, P0172, P0174, P0175, P0201-P0208, P0220, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0279, P0280, P0282, P0283, P0300-P0308, P0351-P0358, P0496, P0601, P0604, P0606, P060D, P0641, P0651, P1516, P2101, P2119, P2120, P2122, P2123, P2125, P2127, P2128, P2135, P2138 or P2176 are not set.
- The engine speed is between 450-4,000 RPM.
- The manifold absolute pressure (MAP) is greater than 5 kPa.
- The mass air flow (MAF) is greater than 2 g/s.
- The ignition voltage is greater than 10 volts.

Throttle Learn

Scan Tool Idle Learn or Idle Learn Reset Procedure - Performed after the throttle body is cleaned or replaced

1. Ignition ON, engine OFF, perform the Idle Learn or Idle Learn Reset in Configuration/Reset or Module Setup.
2. Engine idling, observe the scan tool Throttle Body Idle Airflow Compensation parameter. The Throttle Body Idle Airflow Compensation value should equal 0 % and the engine should be idling at a normal idle speed.
3. Clear the DTCs and return to the diagnostic that referred you here.

Service Bay/On Road Idle Learn Procedure - Performed after the ECM is programmed or replaced

NOTE: Do NOT perform this procedure if DTCs are set. Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

1. Engine idling for 3 min.
2. Observe the scan tool Desired Idle Speed and the actual Engine Speed parameters.
3. The ECM will start to learn the new idle cells and the Desired Idle Speed should start to decrease.
4. Ignition OFF for 60 s.
5. Start and idle the engine for 3 min.
6. After the 3 min run time the engine should be idling normal.

NOTE: During the drive cycle the check engine light may come on with idle speed DTCs. If idle speed codes are set, clear codes so the ECM can continue to learn.

- If the engine idle speed has not been learned the vehicle will need to be driven at speeds above 70 km/h (44 mph) with several decelerations and extended idles.
7. After the drive cycle, the engine should be idling normally.
 - If the engine idle speed has not been learned, turn OFF the ignition for 60 s and repeat step 6.
 8. Once the engine speed has returned to normal, clear DTCs and return to the diagnostic that referred you here.

THROTTLE BODY INSPECTION AND CLEANING

NOTE: Over extended time and mileage, deposits may accumulate on the back of the throttle valve plate. The source of the deposit is exhaust gas. Typically these deposits pose no problem. Occasionally the deposit may accumulate to a point where perceived pedal effort or throttle valve movement is affected. This procedure should not be performed on vehicles with mileage under 80, 450 km (50, 000 mi).

1. Remove the air cleaner outlet duct. Refer to Air Cleaner Assembly Replacement.

WARNING: Turn OFF the ignition before inserting fingers into the throttle bore. Unexpected movement of the throttle blade could cause personal injury.

CAUTION: Do not insert any tools into the throttle body bore in order to avoid damage to the throttle valve plate.

2. Inspect the throttle body bore and the throttle valve plate for deposits. You will need to open the throttle valve in order to inspect all surfaces.

CAUTION: Do not use any solvent that contains Methyl Ethyl Ketone (MEK). This solvent may damage fuel system components.

3. Clean the throttle body bore and the throttle valve plate using a clean shop towel with an appropriate cleaner.
4. Install the air cleaner outlet duct. Refer to **Air Cleaner Assembly Replacement**.
5. Perform the throttle/idle learn procedure. Refer to **Q38 Throttle Body: Throttle/Idle Learn**.

ENGINE COOLANT TEMPERATURE SENSOR REPLACEMENT (RADIATOR)

Fig. 4: Engine Coolant Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

Engine Coolant Temperature Sensor Replacement (Radiator)

Callout	Component Name
WARNING: Allow sufficient time for the engine to cool before removing the ECT sensor. A hot engine may cause an excessive coolant loss or a personal injury.	
Preliminary Procedures 1. Drain the cooling system. Refer to <u>Cooling System Draining and Filling</u> . 2. Disconnect the connector plug.	
	Engine Coolant Temperature Sensor

CAUTION:
Refer to Fastener Caution .

- 1 **Procedure**
Remove the coolant temperature sensor (1).
Tighten
12 (9 lb ft)

ENGINE COOLANT TEMPERATURE SENSOR REPLACEMENT (THERMOSTAT)

Removal Procedure

Fig. 5: Engine Coolant Temperature Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

WARNING: Allow sufficient time for the engine to cool before removing the ECT sensor. A hot engine may cause an excessive coolant loss or a personal injury.

1. Drain the engine coolant. Refer to Cooling System Draining and Filling .

2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.
4. Disconnect the engine coolant temperature sensor connector (2).
5. Remove the engine coolant temperature sensor (1).

Installation Procedure

Fig. 6: Engine Coolant Temperature Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to **Component Fastener Tightening Caution** .

1. Install the engine coolant temperature sensor (1) and tighten to 33 (24 lb ft).
2. Connect the engine coolant temperature sensor connector (2).
3. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.
4. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
5. Refill the engine coolant. Refer to **Cooling System Draining and Filling** .

MASS AIRFLOW SENSOR REPLACEMENT

Fig. 7: Mass Airflow Sensor

Courtesy of GENERAL MOTORS COMPANY

Mass Airflow Sensor Replacement

Callout	Component Name
Preliminary Procedure Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
1	Mass Airflow Sensor Bolt (Qty 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 (18 lb in)
2	Mass Airflow Sensor Procedure Disconnect the electrical wiring harness connector.

MANIFOLD ABSOLUTE PRESSURE SENSOR REPLACEMENT (LL0)

Fig. 8: Manifold Absolute Pressure Sensor
 Courtesy of GENERAL MOTORS COMPANY

Manifold Absolute Pressure Sensor Replacement (LL0)

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Disconnect the manifold absolute pressure sensor connector.	
1	Manifold Absolute Pressure Sensor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the manifold absolute pressure sensor bolt Tighten 10 (89 lb in)
2	Manifold Absolute Pressure Sensor

MANIFOLD ABSOLUTE PRESSURE SENSOR REPLACEMENT (LFM)

Fig. 9: Manifold Absolute Pressure Sensor (LFM)
 Courtesy of GENERAL MOTORS COMPANY

Manifold Absolute Pressure Sensor Replacement (LFM)

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Disconnect the manifold absolute pressure sensor connector.	
1	Manifold Absolute Pressure Sensor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the manifold absolute pressure sensor bolt. Tighten 10 (89 lb in)
2	Manifold Absolute Pressure Sensor

HEATED OXYGEN SENSOR REPLACEMENT - SENSOR 1

Fig. 10: Heated Oxygen Sensor - Sensor 1
 Courtesy of GENERAL MOTORS COMPANY

Heated Oxygen Sensor Replacement - Sensor 1

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Raise the vehicle by its full height. Refer to <u>Lifting and Jacking the Vehicle</u> . 3. Disconnect the heated oxygen sensor-1 connector.	
1	Heated Oxygen Sensor-1 CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the heated oxygen sensor-1. Tighten 42 (31 lb ft) Special Tools EN-48259 Installer/Remover For equivalent regional tools, refer to <u>Special Tools (Diagnostic Tools)</u> .

HEATED OXYGEN SENSOR REPLACEMENT - SENSOR 2

Fig. 11: Heated Oxygen Sensor - Sensor 2
 Courtesy of GENERAL MOTORS COMPANY

Heated Oxygen Sensor Replacement - Sensor 2

Callout	Component Name
Preliminary Procedures	
1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Raise the vehicle by its full height. Refer to <u>Lifting and Jacking the Vehicle</u> . 3. Disconnect the heated oxygen sensor-2 connector.	
1	Heated Oxygen Sensor-2 CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the heated oxygen sensor-2. Tighten 42 (31 lb ft)

KNOCK SENSOR REPLACEMENT

Fig. 12: Knock Sensor
 Courtesy of GENERAL MOTORS COMPANY

Knock Sensor Replacement

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 3. Disconnect the starter connector. Refer to <u>Starter Replacement</u> . 4. Disconnect the generator connector. Refer to <u>Generator Replacement</u> . 5. Remove the intake manifold rear bracket. Refer to <u>Lower Intake Manifold Replacement (LFM)</u> . 6. Disconnect the knock sensor wiring harness connector.	
1	Knock Sensor Retaining Bolt CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the knock sensor retaining bolt. Tighten 25 (18 lb ft)
2	Knock Sensor

THROTTLE BODY ASSEMBLY REPLACEMENT (LL0)

Fig. 13: Throttle Body Assembly

Courtesy of GENERAL MOTORS COMPANY

Throttle Body Assembly Replacement (LL0)

Callout	Component Name
Preliminary Procedures	
1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u>. 3. Disconnect the throttle body connector.	
1	Throttle Body Retaining Bolt (Qty 4) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the throttle body retaining bolts. Tighten 10 (89 lb in)
2	Throttle Body Assembly

THROTTLE BODY ASSEMBLY REPLACEMENT (LFM)

Fig. 14: Throttle Body Assembly (LFM)
 Courtesy of GENERAL MOTORS COMPANY

Throttle Body Assembly Replacement (LFM)

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u>. 3. Disconnect the throttle body connector.	
1	Throttle Body Retaining Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the throttle body retaining bolts. Tighten 10 (89 lb in)
2	Throttle Body Assembly

FUEL PRESSURE RELIEF

WARNING: Relieve the fuel system pressure before servicing fuel system

components in order to reduce the risk of fire and personal injury.

After relieving the system pressure, a small amount of fuel may be released when servicing the fuel lines or connections. In order to reduce the chance of personal injury, cover the regulator and the fuel line fittings with a shop towel before disconnecting. This will catch any fuel that may leak out. Place the towel in an approved container when the disconnection is complete.

1. Open the fuel cap.
2. Remove the fuel pump fuse from the engine room fuse box.
3. Ignition on and allow the engine to idle until the engine stops.
4. After ignition OFF, crank the engine for 10 seconds to verify that there is no fuel.

FUEL PRESSURE GAUGE INSTALLATION AND REMOVAL

Special Tools

EN-49495 Fuel Pressure Gauge

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** .

Installation Procedure

WARNING: Gasoline or gasoline vapors are highly flammable. A fire could occur if an ignition source is present. Never drain or store gasoline or diesel fuel in an open container, due to the possibility of fire or explosion. Have a dry chemical (Class B) fire extinguisher nearby.

WARNING: Wrap a shop towel around the fuel pressure connection in order to reduce the risk of fire and personal injury. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete.

CAUTION: Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:

- The fuel pipe connections
- The hose connections
- The areas surrounding the connections

Fig. 15: Fuel Pressure

Courtesy of GENERAL MOTORS COMPANY

1. Relieve the fuel pressure. Refer to **Fuel Pressure Relief**.
2. Attach the **EN-49495** fuel pressure gauge to the fuel feed pipe and fuel rail.
3. Start the engine
4. Read the fuel pressure from the pressure gauge.

Nominal value

380 kPa (3.8 bar)

METAL COLLAR QUICK CONNECT FITTING SERVICE

Special Tools

EN-47831 Fuel Line Disconnect Tool

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** .

Removal Procedure

Fig. 16: View Of Quick-Connect Fitting Retainer (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

1. Relieve the fuel system pressure before servicing any fuel system connection. Refer to **Fuel Pressure Relief**.
2. Remove the retainer from the quick connect fitting.

Fig. 17: Blowing Dirt Out Of Fitting (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

WARNING: Wear safety glasses when using compressed air, as flying dirt particles may cause eye injury.

3. Blow dirt out of the fitting using compressed air.

Fig. 18: Inserting En-47831 Tool Into Male Connector
Courtesy of GENERAL MOTORS COMPANY

4. Insert the **EN-47831** tool into the male connector, then push inward in order to release the locking tabs.
5. Pull the connection apart.

CAUTION: If necessary, remove rust or burrs from the fuel pipes with an emery cloth. Use a radial motion with the fuel pipe end in order to prevent damage to the O-ring sealing surface. Use a clean shop towel in order to wipe off the male tube ends. Inspect all the connections for dirt and burrs. Clean or replace the components and assemblies as required.

6. Use a clean shop towel in order to wipe off the male pipe end.
7. Inspect both ends of the fitting for dirt and burrs. Clean or replace the components as required.

Installation Procedure

Fig. 19: Oiling Male Pipe Ends (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

WARNING: In order to reduce the risk of fire and personal injury, before connecting fuel pipe fittings, always apply a few drops of clean engine oil to the male pipe ends.

This will ensure proper reconnection and prevent a possible fuel leak.

During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.

1. Apply a few drops of clean engine oil to the male pipe end.

Fig. 20: View Of Connectors (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

2. Push both sides of the fitting together in order to snap the retaining tabs into place.

Fig. 21: Ensuring Connection (Metal Collar) Is Secure
Courtesy of GENERAL MOTORS COMPANY

3. Once installed, pull on both sides of the fitting in order to make sure the connection is secure.

Fig. 22: View Of Quick-Connect Fitting Retainer (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

4. Install the retainer to the quick connect fitting.

FUEL TANK DRAINING

WARNING: Refer to Gasoline/Gasoline Vapors Warning .

WARNING: Refer to Safety Goggles and Fuel Warning .

WARNING: Refer to .

NOTE: The fuel tank must be drained with a suitable, commercially-available fuel removal unit and suction hose - follow safety regulations and national legislation. The fuel tank is fitted with a refill limit float valve. This is

located on the filler neck in the fuel tank. To prevent damaging the refill limit float valve, a suitable suction hose must be used. In the presence of fuel vapors or escaping fuel - observe safety regulations and national legislation. Store drained fuel in a suitable, sealable container.

1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
2. Remove the fuel tank filler cap.
3. Insert a suitable suction hose into the fuel tank filler pipe.
4. Attach a suitable suction hose to the hose used with the hand or air operated pump device.
5. Using a hand or air operated pump drain as much fuel from the tank as possible.

FUEL TANK REPLACEMENT (LL0)

Removal Procedure

1. Open the hood.

WARNING: Refer to **Battery Disconnect Warning** .

2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Relieve the fuel pressure. Refer to **Fuel Pressure Relief**.
4. Ensure that the fuel level in the tank is less than 1/4 full. If necessary, drain the fuel tank to at least this level. Refer to **Fuel Tank Draining**.
5. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
6. Remove the front exhaust muffler assembly. Refer to **Exhaust Muffler Replacement - Front (LL0)** .

Fig. 23: Fuel Tank Filler Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

7. Disconnect the fuel tank filler hose (1) and clamp.
8. Disconnect the fuel tank vent pipe connector (2).
9. Disconnect the fuel feed pipe connector (3).
10. Disconnect the evaporative emission canister purge pipe connector (4).
11. Disconnect the fuel tank electrical extension connector (5).
12. Place a suitable jack under the fuel tank.
13. Remove the fuel tank strap bolts (6) and straps.
14. If needed, remove the parking brake cable retaining clamp and set it away from the path.
15. Remove the fuel tank.

Disassembly Procedure

Fig. 24: Evaporative Emission Canister Purge Pipe
Courtesy of GENERAL MOTORS COMPANY

1. Remove the evaporative emission canister purge pipe (1).
2. Disconnect the fuel tank recirculation pipe connector (2).
3. Disconnect the fuel tank wiring harness (3) electrical connectors from the following:
 - Fuel tank pump
 - Fuel tank pressure sensor
 - Evaporative emission canister solenoid valve
4. Remove the fuel tank vent pipe (4).
5. Remove the fuel feed pipe (5).
6. Remove the evaporative emission canister. Refer to **Evaporative Emission Canister Replacement (LL0)**, **Evaporative Emission Canister Replacement (LFM)**.
7. Remove the fuel pump. Refer to .
8. Remove the fuel tank heat shield. Refer to **Fuel Tank Heat Shield Replacement (LL0)** , **Fuel Tank Heat Shield Replacement (LFM)** .

Assembly Procedure

1. Install the fuel tank heat shield. Refer to **Fuel Tank Heat Shield Replacement (LL0)** , **Fuel Tank Heat**

Shield Replacement (LFM) .

2. Install the fuel pump. Refer to .
3. Install the evaporative emission canister. Refer to **Evaporative Emission Canister Replacement (LL0)**, **Evaporative Emission Canister Replacement (LFM)**.

Fig. 25: Evaporative Emission Canister Purge Pipe
Courtesy of GENERAL MOTORS COMPANY

4. Install the fuel tank vent pipe (4).
5. Install the fuel feed pipe (5).
6. Install the evaporative emission canister purge pipe (1).
7. Connect the fuel tank recirculation pipe connector (2).
8. Connect the fuel tank wiring harness (3) electrical connectors to the following:
 - Fuel tank pump
 - Fuel tank pressure sensor
 - Evaporative emission canister solenoid valve

Installation Procedure

Fig. 26: Fuel Tank Filler Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Using the adjustable jack, slowly raise and reposition the fuel tank in order to install the tank to the vehicle.
2. Install the fuel tank strap and strap bolts (6) and tighten to 20 (15 lb ft).
3. Remove the adjustable jack from under the fuel tank.
4. Connect the fuel tank filler hose (1) and clamp.
5. Connect the fuel tank vent pipe connector (2).
6. Connect the fuel feed pipe connector (3).
7. Connect the evaporative emission canister purge pipe connector (4).
8. Connect the fuel tank electrical extension connector (5).
9. Install the front exhaust muffler assembly. Refer to **Exhaust Muffler Replacement - Front (LL0)** .
10. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
11. Perform the following procedure in order to inspect for leaks:
 1. Turn the ignition ON, with the engine OFF, for 2 seconds.
 2. Turn the ignition OFF for 10 seconds.
 3. Turn the ignition ON, with the engine OFF.
 4. Inspect for fuel leaks.

FUEL TANK REPLACEMENT (LFM)

Removal Procedure

1. Open the hood.

WARNING: Refer to Battery Disconnect Warning .

2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Relieve the fuel pressure. Refer to Fuel Pressure Relief.
4. Ensure that the fuel level in the tank is less than 1/4 full. If necessary, drain the fuel tank to at least this level. Refer to Fuel Tank Draining.
5. Disconnect the fuel line and wiring harness connectors. Refer to Fuel Tank Fuel Pump Module Replacement (LL0), Fuel Tank Fuel Pump Module Replacement (LFM).
6. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 27: Exhaust Pipe Assembly

Courtesy of GENERAL MOTORS COMPANY

7. Remove the exhaust pipe assembly. Refer to **Exhaust Pipe Replacement (LFM)** .
8. If needed, remove the parking brake cable retaining clamp and set it away from the path.

Fig. 28: Fuel Tank Filler Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the fuel tank filler hose (1) and clamp.
10. Disconnect the fuel tank vent pipe and clamp (2).
11. Disconnect the fuel feed pipe connector (3).
12. Disconnect the evaporative emission canister purge pipe (4).
13. Disconnect the evaporative emission canister vent solenoid valve electrical connector (5).
14. Place a suitable jack under the fuel tank.
15. Remove the fuel tank strap bolts (6) and straps.
16. Remove the fuel tank.

Disassembly Procedure

Fig. 29: Evaporative Emission Canister Purge Pipe
Courtesy of GENERAL MOTORS COMPANY

1. Remove the evaporative emission canister purge pipe (1).
2. Disconnect the fuel tank vent pipe connector (2).
3. Remove the fuel tank feed pipe (3).
4. Remove the evaporative emission canister (4). Refer to **Evaporative Emission Canister Replacement (LL0)**, **Evaporative Emission Canister Replacement (LFM)**.
5. Remove the fuel pump (5). Refer to **Fuel Tank Fuel Pump Module Replacement (LL0)**, **Fuel Tank Fuel Pump Module Replacement (LFM)**.
6. Remove the fuel tank heat shield. Refer to **Fuel Tank Heat Shield Replacement (LL0)**, **Fuel Tank Heat Shield Replacement (LFM)**.

Assembly Procedure

1. Install the fuel tank heat shield. Refer to **Fuel Tank Heat Shield Replacement (LL0)**, **Fuel Tank Heat Shield Replacement (LFM)**.
2. Install the fuel pump (5). Refer to **Fuel Tank Fuel Pump Module Replacement (LL0)**, **Fuel Tank Fuel Pump Module Replacement (LFM)**.
3. Install the evaporative emission canister (4). Refer to **Evaporative Emission Canister Replacement (LL0)**, **Evaporative Emission Canister Replacement (LFM)**.

Fig. 30: Evaporative Emission Canister Purge Pipe
Courtesy of GENERAL MOTORS COMPANY

4. Install the fuel tank feed pipe (3).
5. Connect the fuel tank vent pipe connector (2).
6. Install the evaporative emission canister purge pipe (1).

Installation Procedure

Fig. 31: Fuel Tank Filler Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Using the adjustable jack, slowly raise and reposition the fuel tank in order to install the tank to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the fuel tank strap and strap bolts (6) and tighten to 20 (15 lb ft).
3. Remove the adjustable jack from under the fuel tank.
4. Connect the fuel tank filler hose (1) and clamp.
5. Connect the fuel tank vent pipe connector and clamp (2).
6. Connect the fuel feed pipe connector (3).
7. Connect the evaporative emission canister purge pipe connector (4).
8. Connect the evaporative emission canister vent solenoid valve electrical connector (5).

Fig. 32: Exhaust Pipe Assembly

Courtesy of GENERAL MOTORS COMPANY

9. Install the exhaust pipe assembly. Refer to **Exhaust Pipe Replacement (LFM)** .
10. Lower the vehicle. Refer to **Lifting and Jacking the Vehicle** .
11. Connect the fuel line and wiring harness connectors. Refer to **Fuel Tank Fuel Pump Module Replacement (LL0)**, **Fuel Tank Fuel Pump Module Replacement (LFM)**.
12. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
13. Perform the following procedure in order to inspect for leaks:
 1. Turn the ignition ON, with the engine OFF, for 2 seconds.
 2. Turn the ignition OFF for 10 seconds.
 3. Turn the ignition ON, with the engine OFF.
 4. Inspect for fuel leaks.

FUEL LEVEL SENSOR REPLACEMENT (LL0)

Fig. 33: Fuel Level Sensor

Courtesy of GENERAL MOTORS COMPANY

Fuel Level Sensor Replacement (LL0)

Callout	Component Name
Preliminary Procedures Remove the fuel pump. Refer to Fuel Tank Fuel Pump Module Replacement (LL0) , Fuel Tank Fuel Pump Module Replacement (LFM) .	
1	Fuel Level Sensor Procedure 1. Disconnect the fuel level sensor electrical connector. 2. Remove the fuel level sensor.

FUEL LEVEL SENSOR REPLACEMENT (LFM)

Fig. 34: Fuel Level Sensor (LFM)
 Courtesy of GENERAL MOTORS COMPANY

Fuel Level Sensor Replacement (LFM)

Callout	Component Name
Preliminary Procedure Remove the fuel pump. Refer to Fuel Tank Fuel Pump Module Replacement (LL0) , Fuel Tank Fuel Pump Module Replacement (LFM) .	
1	Fuel Level Sensor Procedure 1. Disconnect the fuel level sensor electrical connector. 2. Remove the fuel level sensor.

FUEL TANK PRESSURE SENSOR REPLACEMENT (LL0)

Fig. 35: Fuel Tank Pressure Sensor
 Courtesy of GENERAL MOTORS COMPANY

Fuel Tank Pressure Sensor Replacement (LL0)

Callout	Component Name
Preliminary Procedures	
1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Fuel Tank Pressure Sensor Procedure 1. Disconnect the fuel tank pressure sensor electrical connector. 2. Remove the fuel tank pressure sensor.

FUEL TANK PRESSURE SENSOR REPLACEMENT (LFM)

Fig. 36: Fuel Tank Pressure Sensor (LFM)
 Courtesy of GENERAL MOTORS COMPANY

Fuel Tank Pressure Sensor Replacement (LFM)

Callout	Component Name
Preliminary Procedures	
1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Fold the rear seat, remove the fuel pump cover. 3. Disconnect the fuel tank pressure sensor electrical connector.	
1	Fuel Tank Pressure Sensor Procedure Remove the fuel tank pressure sensor from the fuel pump.

FUEL TANK FUEL PUMP MODULE REPLACEMENT (LL0)

Fig. 37: Fuel Pump

Courtesy of GENERAL MOTORS COMPANY

Fuel Tank Fuel Pump Module Replacement (LL0)

Callout	Component Name
Preliminary Procedures 1. Remove the fuel tank. Refer to <u>Fuel Tank Replacement (LL0)</u>, <u>Fuel Tank Replacement (LFM)</u>. 2. Disconnect the evaporative emission vent pipe connector and fuel feed connector.	
1	Fuel Pump Lock Ring CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the fuel pump lock ring using J-45747 fuel sending unit wrench. Special Tools J-45747 Fuel Sending Unit Wrench For equivalent regional tools, refer to <u>Special Tools (Diagnostic Tools)</u> .
2	Fuel Pump

FUEL TANK FUEL PUMP MODULE REPLACEMENT (LFM)

Fig. 38: Fuel Tank Fuel Pump Module (LFM)
 Courtesy of GENERAL MOTORS COMPANY

Fuel Tank Fuel Pump Module Replacement (LFM)

Callout	Component Name
Preliminary Procedures	
1. Relieve the fuel pressure. Refer to <u>Fuel Pressure Relief</u> . 2. Disconnect battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 3. Fold rear seat, remove fuel pump cover, and disconnect fuel line and wiring harness.	
1	Fuel Pump Lock Ring Procedure Remove fuel pump lock ring using EN-50167 ring. Special Tools EN-50167 Fuel Pump Lock Ring Remover/Installer For equivalent regional tools, refer to <u>Special Tools (Diagnostic Tools)</u> .
2	Fuel Pump Procedure Remove fuel pump assemble above.

FUEL INJECTION FUEL RAIL ASSEMBLY REPLACEMENT (LFM)

Removal Procedure

1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
2. Relieve the fuel pressure. Refer to **Fuel Pressure Relief**.
3. Remove the upper intake manifold. Refer to **Upper Intake Manifold Replacement (LFM)** .
4. Remove the 4 ignition coil connectors. Refer to **Ignition Coil Replacement (LL0)**, **Ignition Coil Replacement (LFM)**.
5. Remove the positive crankcase ventilation hose. Refer to **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0)** , **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM)** .
6. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .
7. Remove the intake manifold rear bracket. Refer to **Lower Intake Manifold Replacement (LFM)** .

Fig. 39: Fuel Rail Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the fuel rail retaining bolts (1, 2).
9. Lower the vehicle.

Fig. 40: Fuel Feed Hose Connector
Courtesy of GENERAL MOTORS COMPANY

10. Disconnect the fuel feed hose connector (1) from the fuel rail.
11. Disconnect the 4 fuel injector electrical connectors and remove the fuel injector rail wiring harness (2).
12. Remove the fuel rail and fuel injector (3).

Installation Procedure

Fig. 41: Fuel Feed Hose Connector
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel rail and fuel injector (3).
2. Install the fuel injector rail wiring harness (2) and connect the 4 fuel injector electrical connectors.
3. Connect the fuel feed hose connector (1) to the fuel rail.
4. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 42: Fuel Rail Retaining Bolts
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Install the fuel rail retaining bolts (1, 2) and tighten to 10 (89 lb in)
6. Install the intake manifold rear bracket. Refer to Lower Intake Manifold Replacement (LFM) .
7. Lower the vehicle.
8. Install the positive crankcase ventilation hose. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0) , Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM) .
9. Install the 4 ignition coil connectors. Refer to Ignition Coil Replacement (LL0), Ignition Coil Replacement (LFM).
10. Install the upper intake manifold. Refer to Upper Intake Manifold Replacement (LFM) .
11. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

FUEL INJECTION FUEL RAIL ASSEMBLY REPLACEMENT (LL0)

Removal Procedure

1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and

Connection .

2. Relieve the fuel pressure. Refer to **Fuel Pressure Relief.**
3. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement.**
4. Remove the positive crankcase ventilation hose. Refer to **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0) , Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM) .**
5. Disconnect the fuel feed line quick connect fitting from the fuel rail. Refer to **Metal Collar Quick Connect Fitting Service.**
6. Disconnect the fuel rail and fuel injector connector.
7. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle .**
8. Remove the exhaust front pipe assembly. Refer to **Exhaust Front Pipe Replacement (LL0) .**

Fig. 43: Starter Connector Wiring Harness Plug
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the starter connector wiring harness plug (1).
10. Disconnect the generator connector wiring harness plug (2).
11. Remove the 2 intake manifold rear bracket bolts (up) (3).
12. Remove the intake manifold rear bracket bolt (down) (4).
13. Remove the intake manifold bracket (5).

14. Transfer parts as necessary.

Fig. 44: Fuel Rail Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

15. Remove the fuel rail retaining bolts (1, 2).
16. Lower the vehicle.

Fig. 45: Fuel Rail And Fuel Injector
Courtesy of GENERAL MOTORS COMPANY

17. Remove the fuel rail and fuel injector connector (1).

Installation Procedure

Fig. 46: Fuel Rail And Fuel Injector
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel rail and fuel injector (1).
2. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 47: Fuel Rail Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the fuel rail retaining bolts (1, 2) and tighten to 10 (89 lb in).

Fig. 48: Starter Connector Wiring Harness Plug
Courtesy of GENERAL MOTORS COMPANY

4. Install the intake manifold bracket (5).
5. Install the 2 intake manifold rear bracket bolts (up) (3) and tighten to 22 (16 lb ft).
6. Install the intake manifold rear bracket bolt (down) (4) and tighten to 58 (42 lb ft).
7. Connect the starter connector wiring harness plug (1).
8. Connect the generator connector wiring harness plug (2).
9. Install the exhaust front pipe assembly. Refer to **Exhaust Front Pipe Replacement (LL0)** .
10. Lower the vehicle.
11. Connect the fuel rail and fuel injector connector.
12. Connect the fuel feed line quick connect fitting to the fuel rail. Refer to **Metal Collar Quick Connect Fitting Service**.
13. Install the positive crankcase ventilation hose. Refer to **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0)** , **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM)** .
14. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.
15. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .

FUEL INJECTOR REPLACEMENT

Fig. 49: Fuel Injector
 Courtesy of GENERAL MOTORS COMPANY

Fuel Injector Replacement

Callout	Component Name
Preliminary Procedure Remove the fuel rail. Refer to Fuel Injection Fuel Rail Assembly Replacement (LFM) , Fuel Injection Fuel Rail Assembly Replacement (LL0) .	
1	Fuel Injector Retainer Clip (Qty: 4) Procedure Remove the fuel injector retainer clip.
2	Fuel Injector (Qty: 4) Procedure Disconnect the fuel injector pulling down.
3	Fuel Injector Upper O-ring (Qty: 4) Procedure Replace the fuel injector with the New O-ring.
4	Fuel Injector Lower O-ring (Qty: 4) Procedure Replace the fuel injector with the New O-ring.

FUEL TANK FILLER PIPE REPLACEMENT (LL0)

Removal Procedure

Fig. 50: Fuel Tank Filler Pipe

Courtesy of GENERAL MOTORS COMPANY

1. Open the fuel filler door and filler cap.
2. Remove the fuel filler pipe upper bolts (1).
3. Lift and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 51: Fuel Tank Filler Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the fuel tank filler hose (1) and clamp.
5. Disconnect the fuel tank vent pipe connector (2).

Fig. 52: Fuel Tank Filler Pipe Lower Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Remove the fuel tank filler pipe lower bolt (1).
7. Remove the fuel tank filler pipe assembly (2).

Installation Procedure

Fig. 53: Fuel Tank Filler Pipe Lower Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel tank filler pipe assembly (2).

CAUTION: Refer to Fastener Caution .

2. Install the fuel tank filler pipe lower bolt (1) and tighten to 6 (53 lb in).

Fig. 54: Fuel Tank Filler Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

3. Connect the fuel tank filler hose (1) and clamp,
4. Tighten fuel tank filler hose clamp to 6 (53 lb in).
5. Connect the fuel tank vent pipe connector (2).
6. Lower the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 55: Fuel Tank Filler Pipe

Courtesy of GENERAL MOTORS COMPANY

7. Install the fuel filler pipe upper bolts (1) and tighten to 6 (53 lb in).
8. Close the fuel filler door and filler cap.

FUEL TANK FILLER PIPE REPLACEMENT (LFM)

Removal Procedure

Fig. 56: Fuel Tank Filler Pipe

Courtesy of GENERAL MOTORS COMPANY

1. Open the fuel filler door and filler cap.
2. Remove the fuel filler pipe upper bolts (1).
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 57: Fuel Tank Filler Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the fuel tank filler hose (3) and clamp.
5. Disconnect the fuel tank vent pipe (2) and clamp.
6. Remove the fuel tank filler pipe lower bolt (1).
7. Remove the fuel tank filler pipe assembly (4).

Installation Procedure

Fig. 58: Fuel Tank Filler Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel tank filler pipe assembly (4).

CAUTION: Refer to Fastener Caution .

2. Install the fuel tank filler pipe lower bolt (1) and tighten to 6 (53 lb in).
3. Connect the fuel tank filler hose (3) and clamp.
4. Connect the fuel tank vent pipe (2) and clamp.
5. Lower the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 59: Fuel Tank Filler Pipe

Courtesy of GENERAL MOTORS COMPANY

6. Install the fuel filler pipe upper bolts (1) and tighten to 6 (53 lb in).
7. Close the fuel filler cap and filler door.

EVAPORATIVE EMISSION CANISTER REPLACEMENT (LL0)

Fig. 60: Evaporative Emission Canister (LL0)
 Courtesy of GENERAL MOTORS COMPANY

Evaporative Emission Canister Replacement (LL0)

Callout	Component Name
Preliminary Procedures	
1. Remove the fuel tank. Refer to <u>Fuel Tank Replacement (LL0)</u> , <u>Fuel Tank Replacement (LFM)</u> . 2. Disconnect the vent pipe connector and evaporative purge connector.	
1	Fuel Tank Pressure Sensor Procedure 1. Disconnect the fuel tank pressure sensor electrical connector. 2. Remove the fuel tank pressure sensor.
2	Evaporative Emission Canister Solenoid Valve Procedure 1. Disconnect the evaporative emission canister solenoid valve electrical connector. 2. Remove the evaporative emission canister solenoid valve.
3	Evaporative Emission Canister Procedure Remove the evaporative emission canister pushing up from the evaporative emission canister bracket.

EVAPORATIVE EMISSION CANISTER REPLACEMENT (LFM)

Fig. 61: Evaporative Emission Canister (LFM)
Courtesy of GENERAL MOTORS COMPANY

Evaporative Emission Canister Replacement (LFM)

Callout	Component Name
Preliminary Procedures	
1. Remove the fuel tank. Refer to Fuel Tank Replacement (LL0) , Fuel Tank Replacement (LFM) .	
2. Disconnect the fuel line and purge line.	
1	Evaporative Emission Canister Procedure Remove the canister pushing up from the canister bracket.

EVAPORATIVE EMISSION CANISTER PURGE SOLENOID VALVE REPLACEMENT (LL0)

Fig. 62: Evaporative Emission Canister Purge Solenoid Valve
 Courtesy of GENERAL MOTORS COMPANY

Evaporative Emission Canister Purge Solenoid Valve Replacement (LL0)

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Disconnect the evaporative emission canister purge solenoid valve electrical connector. 3. Disconnect the evaporative emission pipe connector.	
1	Evaporative Emission Canister Purge Solenoid Valve Bolt CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the evaporative emission canister purge solenoid valve bolt. Tighten 10 (89 lb in)
2	Evaporative Emission Canister Purge Solenoid Valve

EVAPORATIVE EMISSION CANISTER PURGE SOLENOID VALVE REPLACEMENT (LFM)

Fig. 63: Evaporative Emission Canister Purge Solenoid Valve
 Courtesy of GENERAL MOTORS COMPANY

Evaporative Emission Canister Purge Solenoid Valve Replacement (LFM)

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Disconnect the evaporative emission canister purge solenoid valve electrical connector. 3. Disconnect the evaporative emission pipe connector.	
1	Evaporative Emission Canister Purge Solenoid Valve Bolt CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the evaporative emission canister purge solenoid valve bolt. Tighten 10 (89 lb in)
2	Evaporative Emission Canister Purge Solenoid Valve

EVAPORATIVE EMISSION CANISTER VENT SOLENOID VALVE REPLACEMENT (LL0)

Fig. 64: Evaporative Emission Canister Vent Solenoid Valve
 Courtesy of GENERAL MOTORS COMPANY

Evaporative Emission Canister Vent Solenoid Valve Replacement (LL0)

Callout	Component Name
Preliminary Procedure Remove the evaporative emission canister. Refer to <u>Evaporative Emission Canister Replacement (LL0)</u> , <u>Evaporative Emission Canister Replacement (LFM)</u> .	
1	Evaporative Emission Canister Vent Solenoid Valve Procedure 1. Disconnect the evaporative emission canister vent solenoid valve electrical connector. 2. Remove the evaporative emission canister vent solenoid valve.

EVAPORATIVE EMISSION CANISTER VENT SOLENOID VALVE REPLACEMENT (LFM)

Fig. 65: Evaporative Emission Canister Vent Solenoid Valve
 Courtesy of GENERAL MOTORS COMPANY

Evaporative Emission Canister Vent Solenoid Valve Replacement (LFM)

Callout	Component Name
Preliminary Procedure Remove the evaporative emission canister. Refer to <u>Evaporative Emission Canister Replacement (LL0)</u> , <u>Evaporative Emission Canister Replacement (LFM)</u> .	
1	Evaporative Emission Canister Vent Solenoid Valve Procedure 1. Disconnect the evaporative emission canister vent solenoid valve electrical connector. 2. Remove the evaporative emission canister vent solenoid valve.

IGNITION COIL REPLACEMENT (LL0)

Fig. 66: Ignition Coil
 Courtesy of GENERAL MOTORS COMPANY

Ignition Coil Replacement (LL0)

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the ignition coil cover. Refer to <u>Ignition Coil Cover Replacement (LL0)</u> , <u>Ignition Coil Cover Replacement (LFM)</u> . 3. Disconnect the 4 ignition coil connectors.	
1	Ignition Coil Cover Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the ignition coil bolts (1). Tighten 10 (89 lb in)
2	Ignition Coil (Qty: 4) Procedure Transfer parts as necessary.

IGNITION COIL REPLACEMENT (LFM)

Fig. 67: Ignition Coil (LFM)

Courtesy of GENERAL MOTORS COMPANY

Ignition Coil Replacement (LFM)

Callout	Component Name
Preliminary Procedures	
1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the ignition coil cover. Refer to <u>Ignition Coil Cover Replacement (LL0)</u> , <u>Ignition Coil Cover Replacement (LFM)</u> . 3. Disconnect the 4 ignition coil connectors.	
1	Ignition Coil Cover Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the ignition coil bolts (1). Tighten 10 (89 lb in)
2	Ignition Coil (Qty: 4) Procedure

Transfer parts as necessary.

SPARK PLUG INSPECTION

Spark Plug Usage

1. Ensure that the correct spark plug is installed. Refer to **Ignition System Specifications** .
2. Ensure that the spark plug has the correct heat range. An incorrect heat range causes the following conditions:
 - Spark plug fouling-colder plug
 - Pre-ignition causing spark plug and/or engine damage-hotter plug

Spark Plug Inspection

Fig. 68: Cross Sectional View Of Spark Plug
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the terminal post (1) for damage.
 - Inspect for a bent or broken terminal post (1).
 - Test for a loose terminal post (1) by twisting and pulling the post. The terminal post (1) should not move.
2. Inspect the insulator (2) for flashover or carbon tracking, soot. This is caused by the electrical charge traveling across the insulator (2) between the terminal post (1) and ground. Inspect for the following conditions:
 - Inspect the spark plug boot for damage.
 - Inspect the spark plug recess area of the cylinder head for moisture, such as oil, coolant or water.
 - A spark plug boot that is saturated causes arcing to ground.

Fig. 69: Inspecting Spark Plug Insulator
Courtesy of GENERAL MOTORS COMPANY

3. Inspect the insulator (2) for cracks. All or part of the electrical charge may arc through the crack instead of the electrodes (3, 4).

Fig. 70: Cutaway/Description View Of Spark Plug
Courtesy of GENERAL MOTORS COMPANY

4. Inspect for evidence of improper arcing.
 - Measure the gap between the center electrode (4) and the side electrode (3) terminals. Refer to an excessively wide electrode gap can prevent correct spark plug operation.
 - Inspect for the correct spark plug torque. Refer to insufficient torque can prevent correct spark plug operation. An over torqued spark plug, causes the insulator (2) to crack.
 - Inspect for signs of tracking that occurred near the insulator tip instead of the center electrode (4).
 - Inspect for a broken or worn side electrode (3).
 - Inspect for a broken, worn or loose center electrode (4) by shaking the spark plug.
5. A rattling sound indicates internal damage.
6. A loose center electrode (4) reduces the spark intensity.
 - Inspect for bridged electrodes (3, 4). Deposits on the electrodes (3, 4) reduce or eliminates the gap.
 - Inspect for worn or missing platinum pads on the electrodes (3, 4) If equipped.
 - Inspect for excessive fouling.
 - Inspect the spark plug recess area of the cylinder head for debris. Dirty or damaged threads can cause the spark plug not to seat correctly during installation.

Spark Plug Visual Inspection

1. Normal operation: brown to grayish-tan with small amounts of white powdery deposits are normal combustion by-products from fuels with additives.
2. Carbon fouled-dry, fluffy black carbon or soot caused by the following conditions:
 - Rich fuel mixtures
 - Leaking fuel injectors
 - Excessive fuel pressure
 - Restricted air filter element
 - Incorrect combustion
 - Reduced ignition system voltage output
 - Weak coils
 - Worn ignition wires
 - Incorrect spark plug gap
 - Excessive idling or slow speeds under light loads can keep spark plug temperatures so low that normal combustion deposits may not burn off.
 - Deposit fouling-oil, coolant or additives that include substances such as silicone, very white coating, reduces the spark intensity. Most powdery deposits will not effect spark intensity unless they form into a glazing over the electrode.

SPARK PLUG REPLACEMENT (LL0)

Fig. 71: Spark Plug

Courtesy of GENERAL MOTORS COMPANY

Spark Plug Replacement (LL0)

Callout	Component Name
Preliminary Procedure Remove the ignition coil. Refer to <u>Ignition Coil Replacement (LL0)</u> , <u>Ignition Coil Replacement (LFM)</u> .	
1	Spark Plug CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the spark plug (1). Tighten 20 (15 lb ft)

SPARK PLUG REPLACEMENT (LFM)

Fig. 72: Spark Plug (LFM)

Courtesy of GENERAL MOTORS COMPANY

Spark Plug Replacement (LFM)

Callout	Component Name
Preliminary Procedure Remove the ignition coil. Refer to <u>Ignition Coil Replacement (LL0)</u> , <u>Ignition Coil Replacement (LFM)</u> .	

Spark Plug

CAUTION:

Refer to Fastener Caution .

1

Procedure

Remove the spark plug (1).

Tighten

20 (15 lb ft)

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE REPLACEMENT (LL0)

Removal Procedure

Fig. 73: Camshaft Position Actuator Solenoid Valve
Courtesy of GENERAL MOTORS COMPANY

1. Open the hood.
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the 2 intake manifold upper bracket bolt (2) and intake manifold upper bracket (1).

4. Disconnect the camshaft position actuator solenoid valve electrical connector.

Fig. 74: Camshaft Position Actuator Solenoid Valve Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the camshaft position actuator solenoid valve bolts (1).
6. Remove the camshaft position actuator solenoid valves (2).
7. Remove the 2 camshaft position actuator solenoid valve seal (3).
8. Transfer parts as necessary.

Installation Procedure

Fig. 75: Camshaft Position Actuator Solenoid Valve Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Lubricate the NEW camshaft position actuator solenoid valve seals with NEW engine oil.

1. Install NEW 2 camshaft position actuator solenoid valve seal (3).
2. Install the camshaft position actuator solenoid valves (2).

CAUTION: Refer to Fastener Caution .

3. Install the camshaft position actuator solenoid valve bolts (1) and tighten to 10 (53 lb in).
4. Connect the camshaft position actuator solenoid valve electrical connector.

Fig. 76: Camshaft Position Actuator Solenoid Valve
Courtesy of GENERAL MOTORS COMPANY

5. Install the intake manifold upper bracket (1).
6. Install the 2 intake manifold upper bracket bolt (2) and tighten to 25 (18 lb ft).
7. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
8. Close the hood.

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE REPLACEMENT (LFM)

Removal Procedure

Fig. 77: Evaporative Emission Canister Purge Solenoid Valve Hose
Courtesy of GENERAL MOTORS COMPANY

1. Open the hood.
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove and reposition the evaporative emission canister purge solenoid valve hose (1) from the upper intake manifold. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement (LL0)**, **Evaporative Emission Canister Purge Solenoid Valve Replacement (LFM)**.
4. Remove and reposition the power brake booster vacuum hose (2) from the upper intake manifold. Refer to **Power Brake Booster Vacuum Hose Replacement** .
5. Disconnect the camshaft position actuator solenoid valve electrical connector.

Fig. 78: Camshaft Position Actuator Solenoid Valve Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the camshaft position actuator solenoid valve bolts (1).
7. Remove the camshaft position actuator solenoid valves (2).
8. Remove the 2 camshaft position actuator solenoid valve seal (3).
9. Transfer parts as necessary.

Installation Procedure

Fig. 79: Camshaft Position Actuator Solenoid Valve Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Lubricate the NEW camshaft position actuator solenoid valve seals with NEW engine oil.

1. Install NEW 2 camshaft position actuator solenoid valve seal (3).
2. Install the camshaft position actuator solenoid valves (2).

CAUTION: Refer to Fastener Caution .

3. Install the camshaft position actuator solenoid valve bolts (1) and tighten to 10 (53 lb in).
4. Connect the camshaft position actuator solenoid valve electrical connector.

Fig. 80: Evaporative Emission Canister Purge Solenoid Valve Hose
Courtesy of GENERAL MOTORS COMPANY

5. Connect the power brake booster vacuum hose (2) from the upper intake manifold. Refer to **Power Brake Booster Vacuum Hose Replacement** .
6. Connect the evaporative emission canister purge solenoid valve hose (1) from the upper intake manifold. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement (LL0)**, **Evaporative Emission Canister Purge Solenoid Valve Replacement (LFM)**.
7. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
8. Close the hood.

CRANKSHAFT POSITION SENSOR REPLACEMENT

Fig. 81: Crankshaft Position Sensor
 Courtesy of GENERAL MOTORS COMPANY

Crankshaft Position Sensor Replacement

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u>. 3. Disconnect the crankshaft position sensor connector.	
1	Crankshaft Position Sensor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the crankshaft position sensor bolt. Tighten 10 (89 lb in)
2	Crankshaft Position Sensor
3	Crankshaft Position Sensor O-ring Seal

CRANKSHAFT POSITION SYSTEM VARIATION LEARN

NOTE: The Crankshaft Position Variation Learn procedure is also required when the following service procedures have been performed, regardless of whether DTC P0315 is set:

- An engine replacement
- An engine control module (ECM) replacement
- A crankshaft balancer replacement
- A crankshaft replacement
- A crankshaft position sensor replacement
- Any engine repairs which disturb the crankshaft to crankshaft position sensor relationship.

NOTE: The ECM monitors certain component signals to determine if all the conditions are met to continue with the Crankshaft Position Variation Learn procedure.

1. Ignition ON, observe the DTC information with a scan tool. Verify no other DTCs are set, except DTCs P0300-P0304 or P0315.
 - If DTCs are set, except DTCs P0300-P0304 or P0315, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.
2. Select the Crankshaft Position Variation Learn Procedure with a scan tool and follow the on screen instructions:
3. Verify DTC P0315 does not set.
 - **If DTC P0315 set or another DTC is present** refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for the applicable DTC that set.
 - **If the DTC does not set**
4. All OK.

CAMSHAFT POSITION SENSOR REPLACEMENT (LFM)

Fig. 82: Camshaft Position Sensor (LFM)
 Courtesy of GENERAL MOTORS COMPANY

Camshaft Position Sensor Replacement (LFM)

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the ignition coil cover. Refer to <u>Ignition Coil Cover Replacement (LL0)</u> , <u>Ignition Coil Cover Replacement (LFM)</u> . 3. Disconnect the camshaft position sensor connectors.	
1	Camshaft Position Sensor Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the camshaft position sensor bolts. Tighten 10 (89 lb in)
2	Camshaft Position Sensor (Qty: 2)

CAMSHAFT POSITION SENSOR REPLACEMENT (LL0)

Fig. 83: Camshaft Position Sensor
 Courtesy of GENERAL MOTORS COMPANY

Camshaft Position Sensor Replacement (LL0)

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the ignition coil cover. Refer to <u>Ignition Coil Cover Replacement (LL0)</u> , <u>Ignition Coil Cover Replacement (LFM)</u> . 3. Disconnect the camshaft position sensor connectors.	
1	Camshaft Position Sensor Bolt (Qty 2) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the camshaft position sensor bolts. Tighten 10 (89 lb in)
2	Camshaft Position Sensor (Qty 2)

AIR CLEANER ELEMENT REPLACEMENT

Fig. 84: Air Cleaner Element
Courtesy of GENERAL MOTORS COMPANY

Air Cleaner Element Replacement

Callout	Component Name
Preliminary Procedure Open the hood.	
1	Air Cleaner Housing Bolt (Qty 6) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the air cleaner housing bolts Tighten 2 (17 lb in)
2	Air Cleaner Upper Housing Procedure Release clip and remove air cleaner upper housing (2).
3	Air Cleaner Element Procedure Replace air cleaner element (3).

AIR CLEANER ASSEMBLY REPLACEMENT

Fig. 85: Air Cleaner Assembly
 Courtesy of GENERAL MOTORS COMPANY

Air Cleaner Assembly Replacement

Callout	Component Name
Preliminary Procedures 1. Open the hood and disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Disconnect the air flow sensor connector.	
1	Breather Hose Procedure Disconnect the breather hose (1) and clamp from the air cleaner outlet duct.
2	Air Cleaner Assembly Retaining Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the air cleaner assembly retaining bolt (3). Tighten 6 (53 lb in)
3	Air Cleaner Assembly Procedure Disconnect the resonator duct from the air cleaner assembly.

AIR CLEANER RESONATOR REPLACEMENT

Fig. 86: Air Cleaner Resonator
Courtesy of GENERAL MOTORS COMPANY

Air Cleaner Resonator Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the front (LH) tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> .	
2. Remove the front (LH) wheel house liner. Refer to <u>Front Wheelhouse Liner Replacement</u> .	
1	Air Cleaner Resonator Assembly Retaining Nut CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove the air cleaner resonator assembly retaining nut (1). Tighten 6 (53 lb in)
2	Air Cleaner Resonator Assembly

ACCELERATOR PEDAL POSITION SENSOR REPLACEMENT

Fig. 87: Accelerator Pedal Position Sensor
 Courtesy of GENERAL MOTORS COMPANY

Accelerator Pedal Position Sensor Replacement

Callout	Component Name
Preliminary Procedure Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
1	Accelerator Pedal Position Sensor Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 6 (53 lb in)
2	Accelerator Pedal Position Sensor Procedure Disconnect the electrical wiring harness connector from accelerator pedal position sensor.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P00B3

Radiator Coolant Temperature (RCT) Sensor Circuit Low Voltage

DTC P00B4

Radiator Coolant Temperature (RCT) Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P00B3	P00B4	P00B4*	P00B6
Low Reference	-	P00B4	-	P00B6
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

Typical Scan Tool Data

Radiator Coolant Temperature Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: Varies with ambient temperature			
Signal	140°C (284°F)	-40°C (-40°F)	-40°C (-40°F)*

Low Reference	-	-40°C (-40°F)	-40°C (-40°F)*
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit/System Description

NOTE: The radiator coolant temperature sensor is referred to as B34B Engine Coolant Temperature Sensor 2 in schematics and other areas.

The radiator coolant temperature (RCT) sensor is a variable resistor that measures the temperature of the engine coolant in the radiator. This diagnostic checks for an open, short to ground or an intermittent circuit condition between the engine control module (ECM) and RCT sensor.

The following table illustrates the difference between temperature, resistance and voltage:

RCT	RCT Resistance	RCT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

P00B3

- The engine run time is greater than 10 s.
- The intake air temperature (IAT) is colder than 70°C (158°F).
- The DTC runs continuously when the above conditions are met.

P00B4

- The engine run time is greater than 60 s.
- The intake air temperature (IAT) is warmer than -7°C (19°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P00B3

The ECM detects that the RCT sensor is warmer than 149°C (300°F) for greater than 10 s.

P00B4

NOTE: The scan tool only displays to -40°C (-40°F).

The ECM detects that the RCT sensor is colder than -60°C (-76°F) for greater than 10 s.

Action Taken When the DTC Sets

- DTCs P00B3 and P00B4 are Type B DTCs.
- The cooling fans will be commanded ON by the ECM.
- The engine coolant temperature gauge is inoperative.

Conditions for Clearing the MIL/DTC

DTC P00B3 and P00B4 are Type B DTCs.

Diagnostic Aids

NOTE: **The engine coolant temperature (ECT) sensor is mounted on the engine and the radiator coolant temperature (RCT) sensor is mounted on the radiator.**

- As the thermostat opens, the RCT sensor temperature should rise steadily, then stabilize once the thermostat opens completely.
- Test the RCT sensor at various temperature levels in order to evaluate the possibility of a skewed sensor.
- If the vehicle has sat for greater than 8 hours, the ECT sensor and the RCT sensor values should display within 3°C (5°F).

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Radiator Coolant Temperature Sensor parameter is between -39 to + 120°C (-38 to +248°F) and changes with engine run time.

- **If not between -39 to + 120°C (-38 to +248°F) or does not change**

Refer to Circuit/System Testing.

- **If between -39 to + 120°C (-38 to +248°F) and changes**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B34B Engine Coolant Temperature Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 ohms between the low reference circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If less than 5 ohms**
3. Ignition ON.
4. Verify the scan tool Radiator Coolant Temperature Sensor parameter is colder than -39°C (-38°F).
 - **If warmer than -39°C (-38°F)**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If colder than -39°C (-38°F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
6. Verify the scan tool Radiator Coolant Temperature Sensor parameter is at 149°C (300°F).
 - **If colder than 149°C (300°F)**

1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, Ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Ignition OFF.
4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If warmer than 140°C (284°F)**
7. Test or replace the B34B Engine Coolant Temperature Sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B34B Engine Coolant Temperature Sensor.
2. Test the RCT Sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the **Temperature Versus Resistance** table. The resistance values should be in range of the table values.
 - **If not within the specified range**
 - Replace the B34B Engine Coolant Temperature Sensor.
 - **If within the specified range**
3. Test for infinite resistance between each terminal and the sensor housing.
 - **If less than infinite resistance**

Replace the B34B Engine Coolant Temperature Sensor.

 - **If infinite resistance**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Engine Coolant Temperature Sensor Replacement (Radiator)** , **Engine Coolant Temperature Sensor Replacement (Thermostat)**
- **Engine Control Module Replacement** engine control module replacement, programming and setup

DTC P00B7: RADIATOR COOLANT TEMPERATURE (RCT) INSUFFICIENT FLOW

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P00B7

Radiator Coolant Temperature (RCT) Insufficient Flow

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P00B3	P00B4	P00B4*	P00B6
Low Reference	-	P00B4	-	P00B6
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

Typical Scan Tool Data

Radiator Coolant Temperature Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running in Closed Loop			
Parameter Normal Range: Varies with ambient temperature			
Radiator Coolant Temperature Sensor Signal	140°C (284°F)	-40°C (-40°F)	-40°C (-40°F)*
Low Reference	-	-40°C (-40°F)	-
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit Description

The engine control module (ECM) monitors the temperature of the engine radiator coolant. The ECM controls the thermostat with a pulse width modulated (PWM) signal. The ECM compares the radiator coolant temperature to the engine coolant temperature in order to determine if there sufficient coolant flow through the thermostat.

Conditions for Running the DTC

- DTCs P00B3, P00B4, P00B6, P0116, P0117 and P0118 are not set.
- The engine run time is greater than 5 m.

OR

- The engine coolant temperature is warmer than 105°C (221°F).
- The DTC runs continuously when the above conditions are met for greater than 5 s.

Conditions for Setting the DTC

NOTE: The scan tool display range is between -40 and + 150°C (-40 and +302°F).

The ECM detects the difference between the RCT sensor and the ECT sensor is greater than 45°C (113°F) when the ECT sensor is warmer than 117°C (242°F) for greater than 5 s.

Action Taken When the DTC Sets

DTC P00B7 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P00B7 is a Type B DTC.

Diagnostic Aids

- The thermostat has a mechanical fail-safe in case of an electrical condition with the thermostat heater. The mechanical thermostat will open at approximately 80°C (176°F). The mechanical thermostat will cycle from approximately 85°C (185°F) to approximately 102°C (215°F).
- A high resistance condition in the RCT sensor circuits may cause this DTC. This condition results in a greater voltage on the RCT sensor signal circuit, which is interpreted by the ECM as a colder RCT.

Circuit/System Verification

1. Ignition ON.

2. Verify that DTC P00B3, P00B4, P0480, P0481, P0597, P0598 or P0599 are not set.

- **If DTC P00B3, P00B4, P0480, P0481, P0597, P0598 or P0599 are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If DTC P00B3, P00B4, P0480, P0481, P0597, P0598 or P0599 are not set**

3. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks.

- **If the coolant in the radiator surge tank is not at the correct level or there are engine coolant leaks**

Refer to **Cooling System Draining and Filling** and **Loss of Coolant**.

- **If the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks**

4. Verify the engine cooling fan operates.

- **If the engine cooling fan does not operate**

Refer to **Cooling Fan Inoperative (LL0)**.

- **If the engine cooling fan operates**

NOTE: Depending on ambient temperature, it may take up to 4 min for the temperature to decrease less than the specified value.

5. Engine idling for 15 min with the A/C OFF.

6. Command the Engine Coolant Thermostat Heater to 100% with a scan tool. Increase the engine speed to 3 000 RPM. Observe the scan tool ECT sensor parameters. The temperature should decrease to less than 85°C (185°F).

- **If the temperature does not decrease to less than 85°C (185°F)**

Refer to Circuit/System Testing.

- **If the temperature does decrease to less than 85°C (185°F)**

7. All OK.

Circuit/System Testing

1. Vehicle OFF, inspect the cooling system for the conditions below. Refer to **Symptoms - Engine Cooling**.

- Weak coolant solution
- Obstructed radiator air flow or bent radiator fins
- Blocked cooling system passages
- Radiator hoses that are restricted, collapsed or deteriorated
- Damaged water pump

- Loss of cooling system pressure
- Leaking surge tank cap
- Leaking radiator hoses
- Cylinder head or an engine block that is cracked or plugged
- **If a condition exists**

Repair or replace the affected component as necessary.

- **If no conditions exist**

2. Replace the E41 Engine Coolant Thermostat Heater.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Engine Coolant Thermostat Replacement

DTC P0480, P0481, P0691, P0692, P0693 OR P0694: COOLING FAN RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Cooling fan speed inoperative without a DTC. 2. Cooling fan always ON without a DTC.				

Circuit/System Description

The engine cooling fan system is composed of one cooling fan, 2 relays, the engine control module (ECM) and the associated wiring. The cooling fan assembly includes 1 resistor mounted in the cooling fan shroud. The cooling fan resistor may be a stand alone component or a part of the cooling fan motor and harness assembly. This combination of components enables the ECM to operate the cooling fan at 2 speeds using two fan control circuits. The ECM activates the applicable relay by grounding the control circuit with a solid state device called a driver. Each driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage. The ECM will operate the cooling fan at either Low or High speed based on the cooling requirements.

Conditions for Running the DTC

LL0 - ECM with 2 Face Mounted Connectors.

- The ignition voltage is 11-32 volts.
- The engine speed is 400 RPM or greater.
- The ECM has commanded the output driver ON and OFF at least once during the ignition cycle.
- DTCs P0480 and P0481 run continuously when the conditions above are met.

LL0 and LFM - ECM with 3 Face Mounted Connectors.

- The ignition voltage is 11 volts or greater.

- The ECM has commanded the output driver ON and OFF at least once during the ignition cycle.
- DTCs P0480 P0481, P0691, P0692 P0693 and P0694 run continuously when the conditions above are met.

Conditions for Setting the DTC

The commanded state of the ECM driver and the actual state of the control circuit do not match for greater than 5 seconds.

Action Taken When the DTC Sets

- DTCs P0480 and P0481 are Type B DTCs - LL0.
- DTCs P0480 P0481, P0691, P0692 P0693 and P0694 are Type B DTCs - LFM and LL0.

Conditions for Clearing the MIL/DTC

- DTCs P0480 and P0481 are Type B DTCs - LL0.
- DTCs P0480 P0481, P0691, P0692 P0693 and P0694 are Type B DTCs - LFM and LL0.

Diagnostic Aids

- The ECM has the capability of providing command to the fan relays even when a scan tool output control is being used. Always refer to the fan control command parameters on the scan tool to know which fans are being commanded ON by the ECM.
- The scan tool cooling fan output control operates as follows:
 - Cooling Fan Relay 1 operates the fan at low speed
 - Cooling Fan Relay 2 operates the fan at a high speed
- When disconnecting or removing fuses and relays from a fuse block, always inspect the component electrical terminals for corrosion and the correct orientation in the fuse block. Test the mating electrical terminals for tightness.

Circuit/System Verification

1. Ignition ON.
2. Verify an audible click is heard or felt from each cooling fan relay when commanding the cooling fan ON and OFF with a scan tool.
 - **If a click is not heard or felt at each of the relays**

Refer to Circuit/System Testing.

- **If a click is heard or felt at each of the relays**
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the KR20 cooling fan relays listed below:
 - KR20C Cooling Fan Low Speed Relay
 - KR20D Cooling Fan High Speed Relay

NOTE: **The following test must be performed on each of the relay coil ignition circuits.**

2. Ignition ON, verify that a test lamp illuminates between ground and the relay coil ignition circuit terminal listed below:
 - KR20C Cooling Fan Low Speed Relay terminal 85
 - KR20D Cooling Fan High Speed Relay terminal 85
 - **If the test lamp does not illuminate and the fuse is good**
 - 1. Ignition OFF and all vehicle systems OFF, it may take up to 2 minutes for all vehicle systems to power down.
 - 2. Test for less than 2 ohms in the ignition circuit of the appropriate KR20 Cooling Fan Relay, end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 - 1. Ignition OFF and all vehicle systems OFF, it may take up to 2 minutes for all vehicle systems to power down.
 - 2. Test for infinite resistance between the relay coil ignition circuits listed below and ground:
 - KR20C Cooling Fan Low Speed Relay terminal 85
 - KR20D Cooling Fan High Speed Relay terminal 85
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance, test all of the appropriate relays for a short and replace as necessary.
 - **If the test lamp illuminates**
3. Ignition OFF, remove the test lamp, ignition ON.

NOTE: The following tests must be performed on the two fan relay control circuits.

4. Connect a DMM, set on the diode setting, between a control circuit terminal listed below and ground:
 - KR20C Cooling Fan Low Speed Relay terminal 86
 - KR20D Cooling Fan High Speed relay terminal 86
5. Verify the DMM reading is greater than 2.5 V or displays O.L.
 - **If 2.5 V or less**
 - 1. Ignition OFF and all vehicle systems OFF, it may take up to 2 minutes for all vehicle systems to power down. Disconnect the X1 harness connector at the K20 Engine Control Module.
 - 2. Test for infinite resistance between the appropriate relay coil control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If greater than 2.5 V or displays O.L.**

NOTE: The following test must be performed on the two fan relay circuits.

6. Verify the DMM reading is less than 1 V when commanding the Cooling Fan Relays ON with a scan tool.

- **If 1 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module, ignition ON.
2. Test for less than 1 V between the appropriate KR20 Cooling Fan Relay control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
3. Ignition OFF.
4. Test for less than 2 ohms in the appropriate KR20 Cooling Fan Relay control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.

- **If less than 1 V**

7. Test or replace the appropriate KR20 Cooling Fan Relay.

Component Testing

1. Ignition OFF.
2. Disconnect a cooling fan relay.
3. Test for 70-110 ohms between terminals 85/2 and 86/1.
 - **If less than 70 ohms or greater than 110 ohms**

Replace the cooling fan relay.

- **If between 70-110 ohms**

4. Test for infinite resistance between following terminals:
 - 30/3 and 86/1
 - 30/3 and 87/5
 - 30/3 and 85/2
 - 85/2 and 87/5
 - **If less than infinite resistance**

Replace the cooling fan relay.

- **If infinite resistance**

5. Install a 20 A fused jumper wire between relay terminal 85/2 and 12 V.
6. Install a jumper wire between relay terminal 86/1 and ground.
7. Test for less than 2 ohms between terminals 30/3 and 87/5.
 - **If 2 ohms or greater**

Replace the cooling fan relay.

- **If less than 2 ohms**

8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Control Module References** for ECM replacement, programming and setup

DTC P0597-P0599: ENGINE COOLANT THERMOSTAT HEATER

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Voltage	P0031, P0037, P0102, P0135, P0141, P0443, P0458, P0597, P0598*	P0031, P0037, P0102, P0135, P0137, P0141, P0458, P0598	-	-
Thermostat Control Circuit	P0597, P0598	P0597	P0599, P0690	-
*Opens the fuse that supplies voltage to the engine coolant thermostat				

Circuit/System Description

The engine control module (ECM) controls the pulse width modulated (PWM) thermostat. The thermostat

controls coolant flow and regulates the engine operating temperature. Ignition voltage is supplied directly to the thermostat through a fuse. The ECM controls the thermostat by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTCs

- The ignition is ON or the engine is running.
- The DTCs run continuously once the above condition is met

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 15 seconds.

Action Taken When the DTC Sets

- DTCs P0597, P0598 and P0599 are Type B DTCs.
- The engine control module commands the engine cooling fans ON.

Conditions for Clearing the DTC

DTCs P0597, P0598 and P0599 are Type B DTCs.

Diagnostic Aids

- A low engine coolant level could cause the thermostat heater to overheat and set a DTC.
- The thermostat has a mechanical fail-safe in case of an electrical condition with the thermostat heater. The mechanical thermostat will open at approximately 80°C (176°F). The mechanical thermostat will cycle from approximately 85°C (185°F) to approximately 102°C (215°F).

Circuit/System Verification

1. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks.
Loss of Coolant and **Cooling System Draining and Filling**

- **If the coolant level is not correct**

Repair as necessary.

- **If the coolant level is correct**

2. Ignition ON.
3. Verify the parameters listed below do not display Malfunction when commanding the Engine Coolant Thermostat Heater ON and OFF with a scan tool.
 - Engine Coolant Thermostat Heater Control Circuit Low Voltage Test Status
 - Engine Coolant Thermostat Heater Control Circuit Open Test Status
 - Engine Coolant Thermostat Heater Control Circuit High Voltage Test Status
 - **If Malfunction is displayed**
4. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure records data.
5. Verify the DTC does not set.
 - **If any DTC sets**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the E41 Engine Coolant Thermostat Heater, Ignition ON.

2. Verify that a test lamp illuminates between the ignition circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance, test all the components connected to fuse and replace as necessary.
 - **If the test lamp illuminates**
3. Connect a test lamp between the ignition circuit terminal 1 and the control circuit terminal 2, command the Engine Coolant Thermostat Heater to Increase to 100 % and Decrease to 0 % with a scan tool.
4. Verify that a test lamp turns On and OFF.
 - **If the test is always ON**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
 - 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
 - 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms replace the K20 Engine Control Module.
 - **If Malfunction is displayed**
5. Test or replace the E41 Engine Coolant Thermostat Heater.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Engine Coolant Thermostat Replacement** for E41 Engine Coolant Thermostat Heater replacement.

DTC P112F: RADIATOR COOLANT TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P112F

Radiator Coolant Temperature Sensor Not Plausible

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P00B3	P00B4	P00B4*	P112F
Low Reference	-	P00B4	-	P112F
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

Typical Scan Tool Data

Radiator Coolant Temperature Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: Varies with ambient temperature			
Signal	140°C (284°F)	-40°C (-40°F)	-40°C (-40°F)*
Low Reference	-	-40°C (-40°F)	-40°C (-40°F)*
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit Description

NOTE: The radiator coolant temperature sensor is referred to as B34B Engine Coolant Temperature Sensor 2 in schematics and other areas.

The engine coolant radiator temperature sensor is a variable resistor that measures the temperature of the engine coolant in the radiator. The engine control module (ECM) supplies 5 volts to the engine coolant radiator temperature signal circuit and supplies a ground to the low reference circuit. The purpose of this diagnostic is to determine if the input from the RCT sensor is skewed warmer than normal. The internal clock of the ECM will record the amount of time the engine is OFF. If the required engine OFF time is met at start-up, the ECM will compare the temperature difference between the actual measured RCT and ECT sensors.

The following table illustrates the difference between temperature, resistance and voltage:

RCT	RCT Resistance	RCT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

- DTCs P00B3, P00B4, P0112, P0113, P0117, P0118, P0502, P0503, P111E or P2610 are not set.
- The vehicle has been OFF for greater than 8 hours before vehicle ON.
- The engine is running.
- The intake air temperature (IAT) is warmer than -7°C (19°F).
- The fuel level is greater than 10 percent.
- The DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM determines the absolute difference of temperature between the RCT start up temperature and ECT start up temperature is greater than 20°C (68°F).

Action Taken When the DTC Sets

DTC P112F is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P112F is a Type B DTC.

Diagnostic Aids

NOTE: The engine coolant temperature (ECT) sensor is mounted on the engine and the radiator coolant temperature (RCT) sensor is mounted on the radiator.

- As the thermostat opens, the radiator coolant temperature sensor signal should rise steadily, then stabilize once the thermostat opens completely.
- Inspect for the correct operation of the engine cooling system and verify the correct coolant level.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Radiator Coolant Temperature Sensor parameter is between -39 to + 120°C (-38 to +248°F) and changes with engine run time.
 - **If not between -39 to + 120°C (-38 to +248°F) or does not change**

Refer to Circuit/System Testing.

- **If between -39 to + 120°C (-38 to +248°F) and changes**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B34B Engine Coolant Temperature Sensor 2. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the low reference terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K20 Engine Control Module.
 - **If less than 5 ohms**
- 3. Ignition ON.
- 4. Verify the scan tool Radiator Coolant Temperature Sensor parameter is colder than -39°C (-38°F).
 - **If warmer than -39°C (-38°F)**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If colder than -39°C (-38°F)**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
- 6. Ignition ON, Verify the scan tool Radiator Coolant Temperature Sensor parameter is warmer than 140°C (284°F).
 - **If colder than the 140°C (284°F)**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, Ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF.
 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If warmer than 140°C (284°F)**
- 7. Test or replace the B34B Engine Coolant Temperature Sensor 2.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B34 Engine Coolant Temperature Sensor.
2. Test the ECT sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the **Temperature Versus Resistance** table. The resistance values should be in range of the table values.
 - **If not within the specified range**
 - Replace the B34B Engine Coolant Temperature Sensor.
 - **If within the specified range**
3. Test for infinite resistance between each terminal and the sensor housing.
 - **If less than infinite resistance**

Replace the B34B Engine Coolant Temperature Sensor.

- If infinite resistance

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Engine Coolant Temperature Sensor Replacement (Radiator)** , **Engine Coolant Temperature Sensor Replacement (Thermostat)** for radiator temperature sensor replacement.
- **Engine Control Module Replacement** for engine control module replacement, programming and setup.

DTC P2181: ENGINE COOLING SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P2181

Engine Cooling System Performance

Circuit/System Description

The engine control module (ECM) monitors temperature difference between the engine coolant temperature (ECT) sensor and the radiator coolant temperature (RCT) sensor during a cold start-up. The purpose of this diagnostic is to analyze the engine coolant thermostat for being stuck open.

Conditions for Running the DTC

- DTCs P00B3, P00B4, P00B6, P0101, P0102, P0103, P0111, P0112, P0113, P0114, P0116, P0117 or P0118 are not set.
- The engine run time is between 70 s and 30 min.
- The engine coolant temperature (ECT) sensor at start-up is between -10°C to +59°C (14°F to 138°F).
- The intake air temperature (IAT) sensor is between -7°C to +60°C (-4°F to +140°F).
- The airflow into the engine is between 1 to 100 g/s.
- The DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM detects the engine coolant thermostat is stuck open for at least 2.5 min.

Action Taken When the DTC Sets

DTC P2181 is a Type B DTC

Conditions for Clearing the DTC

DTC P2181 is a Type B DTC

Diagnostic Aids

- Insufficient vehicle interior heating is an indication of improper thermostat operation.
- The scan tool Desired ECT Sensor and the ECT Sensor parameters should be within 5°C (9°F) when the engine is at operating temperature.
- A resistance condition in the ECT sensor circuits may cause this DTC. This condition results in a greater voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a colder ECT.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine running, observe the DTC information with a scan tool. DTC P00B3, P00B4, P00B6, P0117 or P0118 should not be set.
 - If a DTC is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

2. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks. Refer to **Cooling System Draining and Filling** and **Loss of Coolant**.

NOTE: **Depending on ambient temperature, it may take up to 4 min for the temperature to increase greater than the specified value.**

3. Engine idling for 15 min with the A/C OFF. Verify the engine cooling fan is not ON at all times.
4. Command the Engine Coolant Thermostat Heater to 0 % with a scan tool. Increase the engine speed to 3,000 RPM. Observe the scan tool ECT sensor parameter. The temperature should increase to greater than 102°C (215°F).
 - If less than the specified value, replace the E41 engine coolant thermostat heater.
5. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Engine Coolant Thermostat Replacement

SYMPTOMS - ENGINE COOLING

Important Preliminary Inspections Before Starting

Before using the Symptom diagnosis, perform the following:

- Perform **Diagnostic System Check - Vehicle** and verify all of the following items:
 - Engine control module (ECM) and malfunction indicator lamp (MIL) are operating correctly.
 - There are no diagnostic trouble codes (DTCs) stored.
 - Scan tool data is within a normal operating range.
- Verify the customer concern.
- Perform the Visual/Physical Inspection in this section. The visual/physical inspection is extremely important and can lead to correcting a condition without additional testing. It may also help reveal the cause of an intermittent condition.
- Locate the correct symptom. Perform the tests and inspections associated with the symptom.

Review the entire cooling system operation in order to familiarize yourself with the system functions. Refer to **Cooling Fan Description and Operation** and **Cooling System Description and Operation**.

Visual/Physical Inspection

CAUTION: Use the connector test adapter kit EL-35616-F for any test that requires probing the following items:

- **The control module harness connectors**
- **The electrical center fuse/relay cavities**
- **The component terminals**
- **The component harness connector**

Using this kit will prevent damage caused by the improper probing of connector terminals.

Several of the symptom procedures call for a careful visual and physical inspection. This can lead to correcting a condition without further tests and can save time. This inspection should include the following:

- Ensure that the control module grounds are clean, tight and correctly located.
- Inspect cooling system hoses and pipes for splits, kinks and improper connections. Inspect thoroughly for any type of leak or restriction.
- Inspect for a dirty or restricted radiator or HVAC condenser.
- Inspect for aftermarket devices which could affect the operation of the cooling system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the coolant recovery reservoir for proper coolant level.

Identifying Intermittent Conditions

Many intermittent conditions occur with harness or connector movement due to engine torque, rough pavement, vibration or physical movement of a component. Refer to the following for a list to help isolate an intermittent condition:

- Water intrusion in connectors, terminals or components
- Poor connector mating
- Terminal contact
- High circuit or component resistance-High resistance can include any resistance, regardless of the amount, which can interrupt the operation of the component.
- Harness' that are routed too tight or chaffed circuits
- High or low ambient temperatures
- High or low engine coolant temperatures
- High underhood temperatures
- Heat build up in components or circuits due to circuit resistance, poor terminal contact or high electrical load
- High or low system voltage
- High vehicle load conditions
- Rough road surface
- Electro-magnetic interference (EMI)/circuit interference from relays, solenoids or other electrical surge

- Incorrect installation of non-factory, aftermarket or after factory add on accessories

If an intermittent fault is detected, refer to **Testing for Intermittent Conditions and Poor Connections** for specific strategies in diagnosing intermittent conditions.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Cooling Fan Always On (LL0)**
- **Cooling Fan Inoperative (LL0)**
- **Engine Overheating**
- **Loss of Coolant**
- **Thermostat Diagnosis**
- **Engine Fails To Reach Normal Operating Temperature**

COOLING FAN ALWAYS ON (LL0)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Circuit/System Description

The engine cooling fan system consists of a cooling fan assembly containing one electric cooling fan. The engine control module (ECM) uses two fan control circuits and a series of two relays to command the fans ON in either high speed or low speed, depending on cooling requirements. The ECM activates the applicable relay by grounding the control circuit with a solid state device called a driver. Each driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage. In low speed, the fan is turned ON at a reduced speed. High speed has the fan turned ON at full speed.

Diagnostic Aids

- The scan tool cooling fan output control operates as follows:
 - Cooling Fan Relay 1 operates both fans at a low speed
 - Cooling Fan Relay 2 operates one fan at a high speed
- Certain resistance conditions with IAT or ECT sensors may cause unwarranted cooling fan activation. If the ECM is commanding the cooling fans ON for no apparent reason and without any component or system DTCs set, the IAT or ECT sensor may be skewed. If this condition is suspected, refer to the temperature versus resistance tables in the appropriate Engine Controls subsection.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC P0480 or P0481 is not set.
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**
3. Verify the scan tool parameters listed below display OFF:
 - Cooling Fan Relay 1 Command
 - Cooling Fan Relays 2 Command
 - **If a scan tool parameter displays ON**

Refer to Diagnostic Aids and **Symptoms - Engine Cooling** for further diagnosis.

- **If both scan tool parameters display OFF**
4. Verify that the fan is not activated.
 - **If a fan is operating**

Refer to Circuit/System Testing.

- **If the fan is OFF**

5. All OK.

Circuit/System Testing

Cooling Fan Always ON

1. Ignition OFF, disconnect the KR20C Cooling Fan Low Speed Relay and KR20D Cooling Fan High Speed Relay one at a time, ignition ON.
2. Verify that the cooling fan is OFF.
 - **If the cooling fan is ON after both relays are removed**
 1. Ignition OFF, disconnect the harness connector at the G10 Cooling Fan Motor, ignition ON.
 2. Test for less than 1 V between the appropriate output control circuit terminal 87 and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - **If the cooling fan is OFF after both relays are removed**
3. Test or replace the appropriate cooling fan relay.

Component Testing

1. Ignition OFF.
2. Disconnect a cooling fan relay.
3. Test for 70-110 ohms between terminals 85/2 and 86/1.
 - **If less than 70 ohms or greater than 110 ohms**

Replace the cooling fan relay.

- **If between 70-110 ohms**

4. Test for infinite resistance between following terminals:
 - 30/3 and 86/1
 - 30/3 and 87/5
 - 30/3 and 85/2
 - 85/2 and 87/5

- **If less than infinite resistance**

Replace the cooling fan relay.

- **If infinite resistance**

5. Install a 20 A fused jumper wire between relay terminal 85/2 and 12 V.
6. Install a jumper wire between relay terminal 86/1 and ground.
7. Test for less than 2 ohms between terminals 30/3 and 87/5.

- If 2 ohms or greater

Replace the cooling fan relay.

- If less than 2 ohms

8. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Relay Replacement (Within an Electrical Center) , Relay Replacement (Attached to Wire Harness)

COOLING FAN INOPERATIVE (LL0)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The engine cooling fan system is composed of one cooling fan, 2 relays, the engine control module (ECM) and the associated wiring. The cooling fan assembly includes 1 resistor mounted in the cooling fan shroud. The cooling fan resistor may be a stand alone component or a part of the cooling fan motor and harness assembly. This combination of components enables the ECM to operate the cooling fan at 2 speeds using two fan control circuits. The ECM activates the applicable relay by grounding the control circuit with a solid state device called a driver. Each driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground or shorted to a voltage by monitoring the feedback voltage. The ECM will operate the cooling fan at either Low or High speed based on the cooling requirements.

Diagnostic Aids

- The scan tool cooling fan output control operates as follows:
 - Cooling Fan Relay 1 operates the fan at a low speed
 - Cooling Fan Relay 2 operates the fan at a high speed
- When disconnecting or removing fuses and relays from a fuse block, always inspect the component electrical terminals for corrosion and the correct orientation in the fuse block. Test the mating electrical terminals for tightness.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC P0480, P0481, P0691, P0692, P0693 or P0694 is not set.
 - **If a DTC is set**

Refer to **DTC P0480, P0481, P0691, P0692, P0693 or P0694.**

- **If no DTC is set**
3. Verify that the cooling fan operates at low and high speed, when commanding the appropriate cooling fan relays ON and OFF with a scan tool.
 - **If the cooling fan does not operate at all speeds**

Refer to Circuit/System Testing.

- **If the cooling fan operates at all speeds**
4. All OK.

Circuit/System Testing

Inoperative in Both Speeds

1. Ignition OFF, disconnect the harness connector at the G10 Cooling Fan Motor.
2. Verify that the test lamp illuminates between B+ and ground circuit terminal 2 of the G10 Cooling Fan Motor.

- **If the test lamp does not illuminate**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If the test lamp illuminates**
- 3. Disconnect the KR20D Cooling Fan Relay, ignition ON:
- 4. Verify a test lamp illuminates between the KR20D Cooling Fan High Speed Relay terminal 30 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the KR20D Cooling Fan High Speed Relay terminal 87 and ground:
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance, test or replace the G10 Cooling Fan Motor, replace the fuse as necessary.
 - **If the test lamp illuminates**
- 5. Ignition OFF, install the KR20D Cooling Fan Relay, Ignition ON.
- 6. Command the cooling fan ON at high speed with a scan tool.
- 7. Verify a test lamp illuminates between the G10 Cooling Fan Motor terminals 1 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, remove the test lamp.
 2. Disconnect the KR20D Cooling Fan High Speed Relay.
 3. Test for less than 2 ohms between KR20D High Speed Relay terminal 87 and the G10 Cooling Fan Motor terminal 1.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - **If the test lamp illuminates at each terminal**
- 8. Test or replace the G10 Cooling Fan Motor.

Inoperative in Low Speed

1. Disconnect the KR20C Cooling Fan Low Speed relay, ignition ON:
2. Verify a test lamp illuminates between ground and the KR20C Cooling Fan Low Speed Relay B+ circuit terminal 30.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the relay B+ circuit, end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp and disconnect the R10 Cooling Fan Resistor.
 2. Test for infinite resistance between the relay circuit terminals listed below and ground:
 - KR20C Cooling Fan Low Speed Relay terminal 87.
 - KR20C Cooling Fan Low Speed Relay terminal 30.
 - If less than infinite resistance, repair the short to ground in the circuit. Replace the fuse as necessary.
 - **If the test lamp illuminates**
- 3. Ignition OFF, install the KR20C relay. Disconnect R10 Cooling Fan Resistor, Ignition ON.
- 4. Command the cooling fan ON at low speed with a scan tool.
- 5. Verify a test lamp illuminates between the R10 Cooling Fan Resistor terminal X1-A and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, remove the test lamp.
 2. Disconnect the KR20C Cooling Fan Low Speed Relay.
 3. Test for less than 2 ohms between KR20C Low Speed Relay terminal 87 and Cooling Fan Resistor terminal X1 A.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace KR20C Cooling Fan Low Speed Relay.
 - **If the test lamp illuminates**
- 6. Ignition OFF, reconnect the Cooling Fan Resistor and disconnect the harness connector at the G10 Cooling Fan Motor.
 1. Ignition ON, Command the cooling fan ON at low speed with a scan tool.
 2. Verify a test lamp illuminates between the G10 Cooling Fan Motor terminal 1 and ground.
 - **If the test lamp does not illuminate**
 3. Ignition OFF.
 4. Test for less than 2 ohms between the Cooling Fan Resistor terminal X2 A and G10 Cooling Fan terminal 1, end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - **If the test lamp illuminates**
- 7. Replace the R10 Cooling Fan Resistor.

Inoperative in High Speed

1. Disconnect the KR20D Cooling Fan High Speed Relay, ignition ON:
2. Verify a test lamp illuminates between the KR20D Cooling Fan High Speed Relay and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the relay B+ circuit, end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp illuminates**
- 3. Ignition OFF, install the KR20D Cooling Fan High Speed Relay. Disconnect the harness connector at the G10 Cooling Fan Motor, ignition ON.
- 4. Command the cooling fan ON at high speed with a scan tool.
- 5. Verify a test lamp illuminates between the G10 Cooling Fan Motor terminal 1 and ground.
 - **If the test lamp does not illuminate**
 - 1. Ignition OFF, remove the test lamp.
 - 2. Disconnect the KR20D Cooling Fan High Speed Relay.
 - 3. Test for less than 2 ohms between KR20D High Speed Relay terminal 87 and G10 Cooling Fan Motor terminal 1.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the KR20D Cooling Fan High Speed Relay.

ENGINE OVERHEATING

Engine Overheating

Step	Action	Yes	No
DEFINITION: Either of the following conditions indicate a probable engine overheat condition. - The engine temperature gauge is in the red (overheat) zone and/or the engine temperature indicator is ON. - Hot engine coolant overflows from the coolant recovery reservoir and/or coolant pressure cap onto the ground while the engine is running.			
1	1. Inspect and fill the cooling system, as necessary. 2. Inspect the cooling system for leaks, as necessary. 3. Repair the cooling system leaks, as necessary. Has the inspection/repair been performed?	Go to Step 2	-
2	1. Start the engine and allow the engine to run at approximately 1 200 RPM. 2. Use the Scan Tool in order to verify the overheat condition. Does the Scan Tool verify the engine overheat condition?	Go to Step 3	Go to <u>Engine Heating/Cooling Schematics</u>
3	1. Verify that the cooling fans are operating correctly. 2. Repair the cooling fan system, as necessary.		

	Does the engine still overheat?	Go to Step 4	System OK
4	Perform the following inspections: • Inspect the radiator and the A/C condenser cooling fans for debris or any other obstruction • Inspect the drive belt system and the drive belt tensioner for correct operation in order to ensure that the water pump is rotating correctly. • Inspect for loose, damaged and/or missing air deflector(s). • Check for a pinched or kinked cooling system hose. • Repair the system if necessary.		
	Does the engine still overheat?	Go to Step 5	System OK
5	Inspect the thermostat for correct operation. Does the thermostat operating correctly?	Go to Step 7	Go to Step 6
6	Replace the thermostat. Does the engine still overheat?	Go to Step 7	System OK
7	NOTE: Excessive coolant freeze point protection MAY cause the coolant to boil at low temperatures. 1. Inspect for the correct coolant concentration (mixture). Correct the coolant concentration as necessary. 2. Remove the coolant pressure cap. 3. Start the engine and inspect for a constant flow of air bubbles in the engine coolant. Is there a constant flow of air bubbles in the engine coolant?		
		Go to Step 8	Go to Step 9
8	The probable cause of the engine overheat is combustion chamber gasses leaking into the cooling system. This condition is usually caused by the following: • A worn or damaged cylinder head gasket. • Worn or damaged cylinder head. • A worn and/or damaged engine block.		

	Verify this condition by inspecting the spark plug electrodes and porcelain surrounding the spark plug electrode for signs of coolant. Replace and/or repair the engine internal component(s), as necessary, in order to repair the engine internal coolant leak. Does the engine still overheat?	Go to Step 1	System OK
9	The engine overheat may be caused by a cooling system blockage. Flush the cooling system. Does the engine still overheat?	Go to Step 10	System OK
10	NOTE: It is unlikely that the water pump is the cause of the overheat condition. If NONE of the cooling system passages are restricted, replace the water pump. Does the engine still overheat?	Go to Step 1	System OK

LOSS OF COOLANT

Loss of Coolant

Step	Action	Yes	No
DEFINITION: Loss of coolant in the coolant system internally or externally.			
1	Inspect the coolant level. Is the coolant at the correct level?	Go to Step 6	Go to Step 4
2	Fill the cooling system to the correct level. Is the action complete?	Go to Step 5	-
3	If the engine is suspected to have a coolant leak into a cylinder, the coolant can hydraulically lock the engine. Does the engine crankshaft rotate?	Go to Step 6	Repair the condition in which the engine cannot be cranked. Go to <u>Engine Will Not Crank - Crankshaft Will Not Rotate</u>
4	Engine overheating can cause a loss of coolant. Is the engine overheating?	Go to <u>Engine Overheating</u>	Go to Step 7
5	Extended operation with a low coolant level can cause engine internal component failure. Is the engine knocking?	Repair the engine knock. Refer to <u>Lower Engine Noise, Regardless of Engine Speed</u>	Go to Step 8
6	1. Idle the engine at the normal operation temperature. 2. Inspect for heavy white smoke coming out of the exhaust system.		

	Is a heavy white smoke present from the exhaust pipe?	Go to Step 9	Go to Step 10
7	• Coolant in the exhaust system creates a distinctive, burning coolant odor in the exhaust. • Condensation in the exhaust system can cause an odorless white smoke during engine warm up. Does the white smoke have a burning coolant type odor?	Repair the engine internal coolant leak. Refer to <u>Coolant in Engine Oil</u>	Go to Step 10
8	With the engine idling, inspect the coolant recovery reservoir. Does the coolant recovery system discharge coolant while the engine is idling?	Repair the engine internal coolant leak. Refer to <u>Coolant in Engine Oil</u>	Go to Step 11
9	Visually inspect the hoses and hose retaining clamps at the following locations: • Coolant bypass • Coolant reservoir • Heater core • Coolant bypass valve • Radiator Are any of the hoses leaking?	Repair or replace the leaking component. Refer to the appropriate repair.	Go to Step 12
10	Visually inspect the following component: • Coolant pressure cap • Core plug • Cylinder head gasket • Engine block • Intake manifold • Radiator • Thermostat housing • Water pump Are any of the listed components leaking?	Repair or replace any leaky part.	Go to Step 13
11	1. Pressure test the cooling system. 2. With the cooling system pressurized, visually inspect the components listed in steps 11 and 12.		

	Is there any leakage?	Repair or replace the leaking component.	Go to Step 14
12	Pressure test the coolant pressure cap. Does the coolant pressure cap hold pressure?	Go to Step 13	Replace the coolant pressure cap.
13	Inspect for the following conditions: • A coolant smell inside of the vehicle. • Coolant in the HVAC module drain tube. • Coolant on the vehicle floor covering near the HVAC module. Is coolant present?	Replace the heater core.	Go to Step 15
14	Inspect the underside of the engine oil filler cap for a gray/white milky substance. Is there a milky substance on under the oil fill cap?	Repair the engine internal coolant leak. Refer to <u>Coolant in Engine Oil</u>	Replace the coolant pressure cap.
15	Inspect the engine oil level indicator for a gray/white milky substance. Is there a milky substance on the engine oil level indicator?	Repair the engine internal coolant leak. Refer to <u>Coolant in Engine Oil</u>	Replace the coolant pressure cap.

THERMOSTAT DIAGNOSIS

1. Remove the thermostat from the vehicle. Refer to **Engine Coolant Thermostat Replacement**.
2. Make sure the valve spring is tight when the thermostat is fully closed. If the spring is not tight, replace the thermostat.
3. Suspend the thermostat and a thermometer in a pan of 50/50 mixture of ethylene glycol and water. Do not let the thermostat or the thermometer rest on the bottom of the pan because the uneven concentration of heat on the bottom could result in inaccurate temperature measurements.
4. Heat the pan on a burner.
5. Use the thermometer to measure the temperature of the heated solution.
6. The thermostat should begin to open at 105°C (221°F) and it should be fully open at 120°C (248°F) and it should be fully close at 98° C (208.4° F). If it does not open or close at these temperature, replace the thermostat. Also, the thermostat rod's stroke from the initially open to the fully open should be 8 mm (0.32 in).

ENGINE FAILS TO REACH NORMAL OPERATING TEMPERATURE

Engine Fails To Reach Normal Operating Temperature

Step	Action	Yes	No
	1. Ensure that the cooling system is full. 2. Allow the engine to cool. 3. Start the engine.		

1	4. Turn the air conditioning system off. 5. Inspect the engine cooling fan(s). Is the electric cooling fan on?	Go to Step 2	Go to Step 3
2	1. Diagnose and repair the cooling fan system. 2. Verify the customer complaint. Does the engine still fail to reach normal operating temperature?	Go to Step 3	System OK
3	Install the scan tool to the DLC. Compare the scan tool coolant temperature reading to the I/P cluster coolant temperature. Is the I/P cluster coolant temperature close to the reading on the scan tool?	Go to Step 5	Go to Step 4
4	1. Diagnose and repair the coolant temperature gauge system. 2. Verify the customer complaint. Does the engine still fail to reach normal operating temperature?	Go to Step 5	System OK
5	Inspect the thermostat for correct operation. Is the thermostat operating correctly?	System OK	Go to Step 6
6	1. Replace the thermostat. 2. Verify the customer complaint. Does the engine still fail to reach normal operating temperature?	Go to Step 1	System OK

COOLING SYSTEM LEAK TESTING

WARNING: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, fenders and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

WARNING: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

Fig. 2: Removing Surge Tank Cap

Courtesy of GENERAL MOTORS COMPANY

1. Remove the surge tank cap after the engine cools.
2. Check the coolant level.
3. Install a suitable cooling system pressure tester (b) to the surge tank filler neck using the adapter (a) and pressurize 110-120 kPa (16.0-17.4 psi).
4. Check the coolant leaks on the hoses and connections during 2 minutes.
5. If the leak is checked, replace the parts or repair the connections.

REPAIR INSTRUCTIONS

COOLING SYSTEM DRAINING AND FILLING

Draining Procedure

WARNING: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. Remove the surge tank cap.
2. Raise the vehicle by its full height. Refer to Lifting and Jacking the Vehicle .
3. Place a drain pan under the drain cock.

Fig. 3: Radiator Drain Cock
Courtesy of GENERAL MOTORS COMPANY

4. Remove the compartment splash shield (2). Refer to Front Compartment Splash Shield Replacement .
5. Loosen the radiator coolant drain cock (1) on the radiator.
6. Drain the cooling system.
7. Lower the vehicle.
8. Inspect the coolant.
9. Follow the appropriate procedure based on the condition of the coolant.
 - Normal in appearance-Follow the filling procedure.
 - Discolored-Follow the flush procedure. Refer to Coolant System Flushing.

Filling Procedure

CAUTION: The procedure below must be followed. Improper coolant level could result in a low or high coolant level condition, causing engine

damage.

1. Raise and support the vehicle.

CAUTION: Refer to Fastener Caution .

Fig. 4: Radiator Drain Cock

Courtesy of GENERAL MOTORS COMPANY

2. Tighten the radiator drain cock (1) to 2 (18 lb in).
3. Install the compartment splash shield (2). Refer to Front Compartment Splash Shield Replacement .
4. Lower the vehicle.

NOTE: Use a 50/50 mixture of DEX-COOL antifreeze and clean drinkable water.

5. Slowly fill the radiator with a 50/50 coolant mixture until the coolant level reaches the base of the radiator surge tank.
6. Allow 30 seconds for the coolant level to stabilize and continue to fill the coolant filler neck until the level stabilizes for at least 2 minutes.

7. Start the engine and allow the engine to idle in PARK or NEUTRAL with the parking brake engaged.
8. Slowly fill the coolant mixture until the level stabilizes at the base of the radiator surge tank.
9. Install the coolant pressure cap.
10. Raise the engine RPM to 2500 RPM for 30-40 seconds.
11. Shut the engine OFF.
12. Allow the engine to cool, remove coolant fill cap and repeat steps 3-9 until the coolant level has completely stabilized within the radiator surge tank.
13. Inspect and if necessary, fill the coolant reservoir bottle as necessary.
14. Rinse away any excess coolant from the engine and the engine compartment.
15. Inspect the cooling system for leaks.
16. Top off the radiator surge tank if necessary.

COOLANT SYSTEM FLUSHING

NOTE:

- Do not use a chemical flush.
- Store used coolant in the proper manner, such as in a used engine coolant holding tank.
- Do not pour used coolant down a drain. Ethylene glycol antifreeze is a very toxic chemical.
- Do not dispose of coolant into the sewer system or ground water. This is illegal and ecologically unsound.
- Various methods and equipment can be used to flush the cooling system. If special equipment is used, such as a back flusher, follow the manufactures instruction. However, always remove the thermostat before back flushing the system.

1. Apply the parking brake.
2. Drain the coolant. Refer to Cooling System Draining and Filling.
3. Fill the cooling system with clean drinkable water. Refer to Cooling System Draining and Filling.
4. Start the engine and run at 2, 000 RPM until the thermostat opens.
5. Turn OFF the engine.
6. Drain the coolant system. Refer to Cooling System Draining and Filling.
7. Repeat the above procedure until the water from the coolant system is colorless.
8. Drain the coolant system. Refer to Cooling System Draining and Filling.
9. Repeat the above procedure until the water from the coolant system is colorless. Refer to Cooling System Draining and Filling.

RADIATOR CLEANING

WARNING: NEVER spray water on a hot heat exchanger. The resulting steam could cause personal injury.

CAUTION: The heat exchanger fins are necessary for good heat transfer. Do not brush the fins. This may cause damage to the fins, reducing heat transfer.

NOTE: Blow compressed air through the engine side of the radiator to remove any foreign material, such as insects, leaves and dust.

- Warm water and mild soap may be needed in some conditions.
- Wash the A/C condenser fin.
- Wash the A/C condenser and radiator thoroughly.
- Wash the radiator cooling fin.
- Repair any damaged cooling fin.

RADIATOR SURGE TANK REPLACEMENT (LL0)

Fig. 5: Radiator Surge Tank
Courtesy of GENERAL MOTORS COMPANY

Radiator Surge Tank Replacement (LL0)

Callout	Component Name
Preliminary Procedure	
Drain the cooling system. Refer to <u>Cooling System Draining and Filling.</u>	
	Block Heater Connecting Plug Holder Bolt (Qty: 2)

1	CAUTION: Refer to <u>Fastener Caution</u> . Tighten 8 (71 lb in)
2	Radiator Surge Tank Mounting Bolt (Qty: 2) Tighten 8 (71 lb in)
3	Radiator Surge Tank Outlet Hose & Clamp
4	Radiator Surge Tank Inlet Hose & Clamp
5	Radiator Surge Tank
6	Block Heater Connecting Plug Holder
7	Coolant Hose & Clamp

RADIATOR SURGE TANK REPLACEMENT (LFM)

Fig. 6: Radiator Surge Tank Replacement (LFM)
Courtesy of GENERAL MOTORS COMPANY

Radiator Surge Tank Replacement (LFM)

Callout	Component Name
Preliminary Procedure Drain the cooling system. Refer to <u>Cooling System Draining and Filling</u> .	
	Radiator Surge Tank Mounting Bolt (Qty: 2)

1	CAUTION: Refer to <u>Fastener Caution</u> . Tighten 8 (71 lb in)
2	Radiator Surge Tank
3	Coolant Hose and Clamp
4	Radiator Surge Tank Outlet Hose and Clamp
5	Radiator Surge Tank Inlet Hose and Clamp

RADIATOR SURGE TANK OUTLET HOSE REPLACEMENT

Special Tools

J-38185 Hose Clamp Pliers

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Drain the coolant. Refer to **Cooling System Draining and Filling**.

Fig. 7: Radiator Surge Tank Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

2. Loosen the radiator surge tank outlet hose clamp (4) and remove the radiator surge tank outlet hose from the radiator surge tank (2).
3. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 8: Intake Manifold Rear Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the intake manifold rear bracket bolts (2, 3).
5. Remove the intake manifold rear bracket (1).

Fig. 9: Heater Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

6. Loosen the radiator surge tank outlet hose clamp (1) and remove the radiator surge tank outlet hose from the water pump.
7. Transfer parts as necessary.

Installation Procedure

Fig. 10: Heater Outlet Hose And Clamp

Courtesy of GENERAL MOTORS COMPANY

1. Install the radiator surge tank outlet hose with the radiator surge tank outlet hose clamp (1) to the water pump.

Fig. 11: Intake Manifold Rear Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Install the intake manifold rear bracket (1).

CAUTION: Refer to Fastener Caution .

3. Install the intake manifold rear bracket bolts - up (2) and tighten to 22 (16 lb ft).
4. Install the intake manifold rear bracket bolt- down (3) and tighten to 58 (42 lb ft).

Fig. 12: Radiator Surge Tank Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

5. Lower the vehicle.
6. Install the radiator surge tank outlet hose with the radiator surge tank outlet hose clamp (4) to the radiator surge tank (2).
7. Fill the cooling system. Refer to **Cooling System Draining and Filling**.
8. Start the engine and check for coolant leaks.

RADIATOR INLET HOSE REPLACEMENT

Fig. 13: Radiator Inlet Hose
 Courtesy of GENERAL MOTORS COMPANY

Radiator Inlet Hose Replacement

Callout	Component Name
Preliminary Procedures 1. Open the hood. 2. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 3. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> . 4. Drain the cooling system. Refer to <u>Cooling System Draining and Filling</u>.	
1	Radiator Inlet Hose Clamp (Qty: 2) Procedure Loosen the radiator inlet hose clamp (1).
2	Radiator Inlet Hose

RADIATOR OUTLET HOSE REPLACEMENT

Removal Procedure

Fig. 14: Radiator Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Drain the cooling system. Refer to **Cooling System Draining and Filling**.
3. Loosen the radiator outlet hose clamp (1).
4. Remove the radiator outlet hose from the radiator.
5. Lower the vehicle. Refer to **Lifting and Jacking the Vehicle** .
6. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

Fig. 15: Radiator Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

7. Loosen the radiator outlet hose clamp (1).
8. Remove the radiator outlet hose from the water pump outlet pipe.

Installation Procedure

Fig. 16: Radiator Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install the radiator outlet hose to the water pump outlet pipe.
2. Install the radiator outlet hose clamp (1).
3. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
4. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 17: Radiator Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

5. Install the radiator outlet hose to the radiator.
6. Install the radiator outlet hose clamp (1).
7. Lower the vehicle. Refer to Lifting and Jacking the Vehicle .
8. Fill the cooling system. Refer to Cooling System Draining and Filling.

RADIATOR MOUNTING STUD REPAIR

NOTE: In this vehicle, mounting pin repair system is only applied to lower side of the radiator, not upper.

NOTE: If the radiator is leaky, replace it. Refer to Radiator Replacement.

1. Pressure test the cooling system. Refer to Cooling System Leak Testing.

Fig. 18: Identifying Fracture Surface
Courtesy of GENERAL MOTORS COMPANY

2. Grind the fracture surface (1) with a proper tool.
3. Drill a persistent hole in center of the fracture surface, using a 6 mm (0.24 in) drill.

Fig. 19: Radiator Mounting Pin, Nut And Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: Bolt should not be longer than 35 mm (1.38 in).

4. Install the new radiator mounting pin (2).

Install the nut (3).

RADIATOR OVERFLOW HOSE REPLACEMENT

Fig. 20: Radiator Overflow Hose
 Courtesy of GENERAL MOTORS COMPANY

Radiator Overflow Hose Replacement

Callout	Component Name
Preliminary Procedure Drain the cooling system. Refer to Cooling System Draining and Filling .	
1	Radiator Overflow Hose Clamp (Qty: 2)
2	Radiator Overflow Hose Bracket Nut CAUTION: Refer to Fastener Caution . Procedure Remove the radiator overflow hose bracket nut. Tighten 9 (80 lb ft)
3	Radiator Overflow Hose

ENGINE COOLANT FAN REPLACEMENT

Fig. 21: Engine Coolant Fan
 Courtesy of GENERAL MOTORS COMPANY

Engine Coolant Fan Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the engine coolant fan shroud. Refer to <u>Engine Coolant Fan Shroud Replacement</u>. 2. Disconnect the wiring harness plug of the engine cooling fan.	
1	Engine Coolant Fan Bolt (Qty: 3) Procedure Remove the engine coolant fan bolts. Tighten 3 (27 lb in)
2	Engine Coolant Fan Shroud
3	Engine Coolant Fan

ENGINE COOLANT THERMOSTAT HOUSING REPLACEMENT

Removal Procedure

Fig. 22: Radiator Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

WARNING: In order to avoid personal injury, do not remove the cap or open the cooling system drains from a hot system. Allow the system to cool first.

1. Drain the system. Refer to **Cooling System Draining and Filling**.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.
3. Disconnect the heater inlet hose and clamp (1).
4. Disconnect the coolant hose and clamp (2).
5. Disconnect the radiator inlet hose and clamp (3).

Fig. 23: Engine Coolant Thermostat

Courtesy of GENERAL MOTORS COMPANY

6. Remove the engine coolant thermostat (2). Refer to **Engine Coolant Thermostat Replacement**.

Fig. 24: Engine Coolant Thermostat Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the engine coolant thermostat housing bolts (1).
8. Remove the engine coolant thermostat housing (2).

Installation Procedure

Fig. 25: Engine Coolant Thermostat Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the coolant thermostat housing (2).

CAUTION: Refer to Fastener Caution .

2. Install the engine coolant thermostat housing bolts (1) and tighten to 25 (18 lb ft).

Fig. 26: Engine Coolant Thermostat
Courtesy of GENERAL MOTORS COMPANY

3. Install the engine coolant thermostat (2). Refer to **Engine Coolant Thermostat Replacement**.

Fig. 27: Radiator Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Connect the radiator inlet hose and clamp (3).
5. Connect the coolant hose and clamp (2).
6. Connect the heater inlet hose and clamp (1).
7. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
8. Fill the cooling system. Refer to **Cooling System Draining and Filling**.
9. Start the engine and check for coolant leaks.

ENGINE COOLANT THERMOSTAT REPLACEMENT

Removal Procedure

Fig. 28: Radiator Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Open the hood.
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Drain the cooling system. Refer to **Cooling System Draining and Filling**.
4. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
5. Disconnect the radiator inlet hose and clamp (3).
6. Disconnect the electrical connector from the engine coolant thermostat heater connector.

Fig. 29: Engine Coolant Thermostat Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the engine coolant thermostat bolts (1).
8. Remove the engine coolant thermostat assembly (2).

Installation Procedure

Fig. 30: Engine Coolant Thermostat Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the engine coolant thermostat assembly (2).

CAUTION: Refer to Fastener Caution .

2. Install the 3 engine coolant thermostat bolts (1) and tighten to 10 (89 lb in).

Fig. 31: Radiator Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

3. Connect the electrical connector to the engine coolant thermostat heater connector.
4. Connect the radiator inlet hose and clamp (3).
5. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
6. Fill the cooling system. Refer to **Cooling System Draining and Filling**.
7. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
8. Start the engine and check for coolant leaks.
9. Close the hood.

WATER PUMP REPLACEMENT

Removal Procedure

1. Drain the coolant. Refer to **Cooling System Draining and Filling**.
2. Remove the water pump and generator belt. Refer to **Water Pump and Generator Belt Replacement** .
3. Remove the generator. Refer to **Generator Replacement** .

Fig. 32: Intake Manifold Support Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the intake manifold rear bracket bolts (2, 3).
5. Remove the intake manifold rear bracket (1).

Fig. 33: Heater Outlet Hose And Clamp

Courtesy of GENERAL MOTORS COMPANY

6. Disconnect the radiator surge tank outlet hose and clamp (1).
7. Disconnect the heater outlet hose and clamp (2).
8. Disconnect the water pipe hose and clamp (3).

Fig. 34: Water Pump Bolts

Courtesy of GENERAL MOTORS COMPANY

9. Remove the 4 water pump bolts (1).
10. Remove the water pump assembly (2) from the engine block.
11. Remove the water pump oil seal ring.

Installation Procedure

1. Clean the water pump threads.
2. Insert a NEW water pump seal ring.

Fig. 35: Water Pump Bolts

Courtesy of GENERAL MOTORS COMPANY

3. Install the water pump assembly (2) to engine block.

CAUTION: Refer to Fastener Caution .

4. Install the 4 water pump bolts (1) and tighten to 10 (89 lb in).

Fig. 36: Heater Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

5. Connect the water pipe hose and clamp (3).
6. Connect the heater outlet hose and clamp (2).
7. Connect the radiator surge tank outlet hose and clamp (1).

Fig. 37: Intake Manifold Support Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Install the intake manifold rear bracket (1).
9. Install the intake manifold rear bracket bolts (2) and tighten to 25 (18 lb ft).
10. Install the intake manifold rear bracket bolt (3) and tighten to 46 (34 lb ft).
11. Install the generator. Refer to **Generator Replacement** .
12. Install the water pump and generator belt. Refer to **Water Pump and Generator Belt Replacement** .
13. Fill the engine cooling system. Refer to **Cooling System Draining and Filling**.
14. Start the engine and check for coolant leaks.

ENGINE COOLANT FAN SHROUD REPLACEMENT

Fig. 38: Engine Coolant Fan Shroud
Courtesy of GENERAL MOTORS COMPANY

Engine Coolant Fan Shroud Replacement

Callout	Component Name
Preliminary Procedures	
1. Unclip transmission cooler lines from shroud if equipped. 2. Unclip radiator outlet hose from fan shroud. 3. Disconnect any electrical connectors from the fan shroud.	
1	Engine Coolant Fan Shroud TIP: Unclip engine coolant fan shroud from radiator.

RADIATOR REPLACEMENT

Removal Procedure

1. Drain the cooling system. Refer to Cooling System Draining and Filling.
2. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging.
3. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.
4. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement.
5. Disconnect the radiator inlet hose from the radiator. Refer to Radiator Inlet Hose Replacement.
6. Disconnect the radiator overflow hose from the radiator. Refer to Radiator Overflow Hose Replacement.

7. Disconnect the radiator outlet hose from the radiator. Refer to **Radiator Outlet Hose Replacement**.
8. Remove the transaxle oil cooler hoses from the oil cooler fittings on the radiator. Refer to **Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection** .
9. Remove the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .

Fig. 39: Front Side Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

10. Remove the 3 right side opening cover retainer (1) and right side opening cover (2).
11. Remove the 4 left side opening cover retainer (3) and left side opening cover (4).

Fig. 40: Upper Air Guard Retainers
Courtesy of GENERAL MOTORS COMPANY

12. Remove the 4 upper opening cover retainer (1) and upper opening cover (2).

Fig. 41: Engine Coolant Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

13. Disconnect the engine coolant temperature sensor (1).
14. Remove the air conditioning compressor and condenser upper pipe nut (2).
15. Remove the air conditioning compressor and condenser under pipe nut (3).
16. Remove the air conditioning compressor and condenser pipe from the air conditioning condenser.

Fig. 42: Radiator Support Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

17. Remove the 2 radiator support bracket bolts (1).
18. Remove the 2 radiator support brackets (2).
19. Disconnect electrical connectors from the fan shroud.
20. Remove the radiator and air conditioning condenser and engine coolant fan shroud from the vehicle.

Fig. 43: Engine Coolant Fan Shroud
Courtesy of GENERAL MOTORS COMPANY

21. Unclip engine coolant fan shroud (1) from the radiator (3).
22. Unclip conditioning condenser (2) from the radiator (3).
23. Transfer parts as needed.

Installation Procedure

Fig. 44: Engine Coolant Fan Shroud
Courtesy of GENERAL MOTORS COMPANY

1. Clip the engine coolant fan shroud (1) to the radiator (3).
2. Clip the air conditioning condenser (2) to the radiator (3).
3. Install the radiator and air conditioning condenser and engine coolant fan shroud to the vehicle.

Fig. 45: Radiator Support Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Install the 2 radiator support bracket (2).

CAUTION: Refer to Fastener Caution .

5. Install the 2 radiator support bracket bolt (1) and tighten to 22 (16 lb in).
6. Connect electrical connectors from the fan shroud.

Fig. 46: Engine Coolant Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

7. Install the air conditioning compressor and condenser pipe to the air conditioning condenser.

CAUTION: Refer to Fastener Caution .

8. Install the air conditioning compressor and condenser upper pipe nut (2) and tighten to 11 (96 lb in).
9. Install the air conditioning compressor and condenser under pipe nut (3) and tighten to 11 (96 lb in).
10. Connect the engine coolant temperature sensor (1).

Fig. 47: Upper Air Guard Retainers
Courtesy of GENERAL MOTORS COMPANY

11. Install the upper opening cover (2) and 4 upper opening cover retainer (1).

Fig. 48: Front Side Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

12. Install the left side opening cover (4) and 4 left side opening cover retainer (3).
13. Install the right side opening cover (2) and 3 right side opening cover retainer (1).
14. Install the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .
15. Install the transaxle oil cooler hoses to the oil cooler fittings on the radiator. Refer to **Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection** .
16. Connect the radiator outlet hose to the radiator. Refer to **Radiator Outlet Hose Replacement**.
17. Connect the radiator inlet hose to the radiator. Refer to **Radiator Inlet Hose Replacement**.
18. Connect the radiator overflow hose from the radiator. Refer to **Radiator Overflow Hose Replacement**.
19. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
20. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
21. Fill the cooling system. Refer to **Cooling System Draining and Filling**.
22. Charge the refrigerant system. Refer to **Refrigerant Recovery and Recharging** .
23. Start the engine and check for coolant leaks.

RADIATOR SUPPORT BRACKET REPLACEMENT

Removal Procedure

1. Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .

Fig. 49: Front Side Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

2. Remove the 3 right side opening cover retainer (1) and right side opening cover (2).
3. Remove the 4 left side opening cover retainer (3) and left side opening cover (4).

Fig. 50: Upper Air Guard Retainers
Courtesy of GENERAL MOTORS COMPANY

4. Remove the 4 upper opening cover retainer (1) and upper opening cover (2).

Fig. 51: Radiator Support Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the 2 radiator support bracket bolt (1).
6. Remove the 2 radiator support bracket (2).

Installation Procedure

Fig. 52: Radiator Support Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the 2 radiator support bracket (2).

CAUTION: Refer to Fastener Caution .

2. Install the 2 radiator support bracket bolts (1) and tighten to 22 (16 lb in).

Fig. 53: Upper Air Guard Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Install the upper opening cover (2) and 4 upper opening cover retainers (1).

Fig. 54: Front Side Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

4. Install the left side opening cover (4) and 4 left side opening cover retainers (3).
5. Install the right side opening cover (2) and 3 right side opening cover retainers (1).
6. Install the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .

RADIATOR SUPPORT REPLACEMENT

Fig. 55: Radiator Support

Courtesy of GENERAL MOTORS COMPANY

Radiator Support Replacement

Callout	Component Name
Preliminary Procedure Disconnect the condenser from the radiator. Refer to <u>Radiator Replacement</u> .	
1	Radiator Support Mounting Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 (16 lb ft)
2	Radiator Support Procedure Rotate the radiator support and disconnect it from the radiator.

DESCRIPTION AND OPERATION

COOLING FAN DESCRIPTION AND OPERATION

System Overview

The engine cooling fan system is composed of one cooling fan, 2 relays, the engine control module (ECM) and the associated wiring. The cooling fan assembly includes 1 resistor mounted in the cooling fan shroud. The cooling fan resistor may be a stand alone component or a part of the cooling fan motor and harness assembly. This combination of components enables the ECM to operate the cooling fan at 2 speeds using two fan control circuits. The ECM will operate the cooling fan at either Low or High speed based on the cooling requirements.

Low Speed Operation

The ECM applies ground at the FAN 1 control circuit for the coil side of the low speed cooling fan relay. The energized low speed relay switch closes to supply B+ through the cooling fan resistor, to the engine cooling fan motor. The result is cooling fan operation at a reduced speed.

High Speed Operation

The ECM applies ground at the FAN 2 control circuit for the coil side of the cooling fan high speed relay. The energized high speed relay switch closes to supply B+ directly to the engine cooling fan motor, by-passing the cooling fan resistor. The result is cooling fan operation at full speed.

COOLING SYSTEM DESCRIPTION AND OPERATION

Cooling System

The cooling system maintains the engine operating temperature at the efficient level under any speed and operating condition. When the engine is cold, the cooling system cools the engine slowly or not at all. The slow cooling of the engine allows the engine to warm up quickly. The cooling system includes a radiator and recovery subsystem, cooling fans, a thermostat and housing, an oil cooler, a water pump and a water pump drive belt. The accessory belt drives the water pump. All components must function properly in order for the cooling system to operate. Before the coolant reaches operating temperature of the thermostat, the coolant circulates through water jackets in the engine block, the cylinder head, the heater core and the oil cooler. The coolant pump draws the coolant from the bypass pipe which the pipe receives returning flow from the engine and the heater core. When the coolant reaches the operating temperature of the thermostat, the thermostat opens. The coolant then goes to the radiator where it cools. This system directs some coolant through the hoses or pipes to the heater core and oil cooler. This provides for heating, defrosting and engine oil cooling. The surge tank is connected to the radiator to recover the coolant displaced by expansion from the high temperatures. The surge tank maintains the correct coolant level. The cooling system for this vehicle has no radiator cap or filler neck. The coolant is added to the cooling system through the surge tank.

Water Pump

The belt-driven centrifugal water pump consists of an impeller, a drive shaft and a belt pulley. The water pump is mounted on the front of the transverse-mounted engine and is driven by the accessory belt.

The impeller is supported by a completely sealed bearing. The water pump is serviced as an assembly and cannot be disassembled.

Thermostat

A wax pellet-type thermostat controls the flow of the engine coolant through the engine cooling system. The

thermostat is mounted in the thermostat housing to the rear of the cylinder head. The thermostat stops the flow of the engine coolant from the engine to the radiator to provide faster warm-up and to regulate the coolant temperature. The thermostat remains closed while the engine coolant is cold, preventing circulation of the engine coolant through the radiator.

As the engine warms, the thermostat opens. This allows the engine coolant to flow through the radiator where the heat is dissipated through the radiator. This opening and closing of the thermostat permits enough engine coolant to enter the radiator to keep the engine within proper engine temperature operating limits.

The wax pellet in the thermostat is hermetically sealed in a metal case. The wax element of the thermostat expands when it is heated and contracts when it is cooled.

As the vehicle is driven and the engine warms, the engine coolant temperature increases. When the engine coolant reaches a specified temperature, the wax pellet element in the thermostat expands and exerts pressure against the metal case, forcing the valve open. This allows the engine coolant to flow through the engine cooling system and cool the engine. As the wax pellet cools, the contraction allows a spring to close the valve. To provide fuel economy and low emission benefit during part load driving condition, the electric controlled thermostat enables changing the thermostat opening temperature. Basically, the thermostat begins to open at 105° C (221° F) and is fully open at 120° C (248° F) when the electric energy not assisted.

If a certain driving environment encountered that requiring better cooling performance, the ECM orders to put electric energy to the thermostat. The energized electric heater in the wax pellet gives thermal energy to the wax for assisting the wax expansion. Then the thermostat valve opens earlier than the specified coolant temperature. For this vehicle, the programmed temperature set value by the ECM is 105° C (221° F) for cold and part load driving mode and 90° C (194° F) for hot and full load driving mode.

Radiator

The radiator is a heat exchanger. It consists of a core and 2 tanks. The aluminum core is a tube and fin cross-flow design that extends from the inlet tank to the outlet tank. Fins are placed around the outside of the tubes to improve heat transfer to the atmosphere.

The inlet and outlet tanks are a molded, high temperature, nylon reinforced plastic material. A high temperature rubber gasket seals the tank flange edge to the aluminum core. The tanks are clamped to the core with clinch tabs. The tabs are part of the aluminum header at each end of the core.

The radiator removes heat from the coolant passing through it. The fins on the core transfer heat from the coolant passing through the tubes. As air passes between the fins, it absorbs heat and cools the coolant.

Surge Tank

The surge tank is a plastic tank with a threaded pressure cap. The tank is mounted at a point higher than all other coolant passages. The surge tank provides an air space in the cooling system that allows the coolant to expand and contract. The surge tank provides a coolant fill point and a central air bleed location. During vehicle use, the coolant heats and expands. The increased coolant volume flows into the surge tank. As the coolant circulates, any air is allowed to bubble out. Coolant without air bubbles absorbs heat much better than coolant with bubbles.

THERMOSTAT HEATER CONTROL SYSTEM DESCRIPTION

A conventional thermostat valve is moved only by the coolant temperature. The temperature range at which the thermostat begins to open is fixed and cannot be adjusted. An electric thermostat valve is moved by the coolant temperature and the built-in heater that is controlled electrically by the ECM. The ECM controls the heater by providing a pulse width modulated (PWM) ground to the thermostat heater control circuit. In this system, a desired ECT can be achieved causing the vehicle better fuel consumption and reduced emissions in city driving or slow cruising.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - ENGINE EXHAUST

Diagnostic Starting Point - Engine Exhaust

Begin the system diagnosis by reviewing the exhaust system description and operation. Reviewing the

information will help you determine the correct symptom diagnostic procedure when a malfunction exists.

It will also help you determine if the condition described by the customer is normal operation. To identify the correct procedure for diagnosing the system, refer to **Exhaust System Description**.

Visual/Physical Inspection

- Inspect for aftermarket or non-OEM devices. These could affect the operation and performance of the exhaust system.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, engine temperature, engine load, and frequency of concern.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause any symptom.

Intermittent Conditions

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating as designed.

Symptom List

For the following symptoms, refer to **Restricted Exhaust**.

- Loss of power
- Poor fuel economy
- Poor acceleration

For the following symptoms, refer to **Exhaust Leakage**.

- Exhaust hissing
- Exhaust popping

For the following symptoms, refer to **Exhaust Noise**.

- Exhaust rattle
- Loud exhaust
- Exhaust buzz, groan or hum

RESTRICTED EXHAUST

Test Description

The numbers below refer to the step numbers on the diagnostic table.

The exhaust system has very low back pressure under normal conditions. If the exhaust system is restricted, a significant increase in the exhaust pressure is noticed on the **J-35314-A** exhaust back pressure gauge.

Removing the heated oxygen sensor may set a DTC. When finishing this diagnostic table all codes must be cleared.

4

This step will isolate the catalytic converter from the remainder of the exhaust system.

Restricted Exhaust

Step	Action	Value(s)	Yes	No
Special Tools				
J-35314-A Exhaust Back Pressure Gauge				
1	Did you verify the customers complaint?	-	Go to Step 2	-
2	Did you review the exhaust symptoms diagnostic information and perform the necessary inspections?	-	Go to Step 3	Go to Symptoms - Engine Exhaust.
3	1. Remove the heated oxygen sensor 1. Refer to <u>Heated Oxygen Sensor Replacement - Sensor 1</u> . 2. Install the EN-35314-A exhaust back pressure gauge in place of the heated oxygen sensor 1. 3. Start the engine. 4. Increase and monitor the engine speed at 2, 000 RPM. 5. Observe the exhaust system back pressure reading on the gauge. 6. Check the value.	-	Go to Step 4	Go to Step 4
4	1. Turn the engine off and place the ignition in the lock position. 2. Remove the EN-35314-A exhaust back pressure gauge. 3. Install the heated oxygen sensor 1. Refer to <u>Heated Oxygen Sensor Replacement - Sensor 1</u> . 4. Remove the heated oxygen sensor 2. Refer to <u>Heated Oxygen Sensor Replacement - Sensor 2</u> . 5. Install the EN-35314-A exhaust back pressure gauge in place of the heated oxygen sensor 2.	-		

	6. Start the engine. 7. Increase and monitor the engine speed at 2,000 RPM. 8. Observe the exhaust system back pressure reading on the gauge. Compare the reading with the above value. The values are same?		Go to Step 5	Go to Step 6
5	Inspect the exhaust system for the following conditions: • Damage in the exhaust pipe • Debris in the exhaust pipe • Muffler or resonator internal failure • Two-layer exhaust pipe separation Did you find and correct the condition?	-	Go to Step 7	-
6	Replace the exhaust manifold. Refer to <u>Exhaust Manifold Replacement</u> . Did you find and correct the condition?	-	Go to Step 7	-
7	1. Remove the EN-35314-A exhaust back pressure gauge. 2. Install the heated oxygen sensor 2. Refer to <u>Heated Oxygen Sensor Replacement - Sensor 2</u> . 3. Clear any DTCs. 4. Road test the vehicle in order to verify the repair. Did you correct the condition?	-	System OK	Go to Step 2

EXHAUST LEAKAGE

Exhaust Leakage

Condition	Action
DEFINITION: An exhaust leak may show stains at the area of the leak. The leak may be felt by holding a hand close to the suspected areas or using a smoke pencil. The leak may make a popping or hissing noise. Refer to <u>Symptoms - Engine Exhaust</u> prior to beginning this table.	
Misaligned or incorrectly installed exhaust system components	• Align and tighten the exhaust system components to the required specifications. • Make sure the exhaust hangers are in the proper locations and not loose.

Exhaust leaks at the following connections: • Exhaust manifold to pipe • Flange	Tighten the affected components to the required specifications.
Seals or gaskets leaking • Exhaust manifold to cylinder head • Exhaust pipes to exhaust manifold • Catalytic converter connection	Replace the leaking seal or gasket.
Irregularities at the mating surfaces on the flange connections	Repair as required or replace the affected component.
Exhaust manifold cracked or broken	Replace the exhaust manifold. Refer to <u>Exhaust Manifold Replacement</u> .
Exhaust system component connection welds leaking	Replace the leaking component.
Muffler or resonator, if equipped, damaged or leaking at the seams	Replace the affected muffler. Refer to <u>Exhaust Muffler Replacement</u> .

EXHAUST NOISE

Exhaust Noise

Condition	Action
DEFINITION: An audible or physical noise due to a faulty component or damaged components causing a loose or misaligned exhaust system resulting in a rattle or vibration noise. Refer to <u>Symptoms - Engine Exhaust</u> .	
Popping or hissing noise	Exhaust leak. Refer to <u>Exhaust Leakage</u> .
Loud exhaust	1. Compare to a known good vehicle. 2. Inspect for a damaged or failed muffler. 3. Replace the faulty muffler. Refer to <u>Exhaust Muffler Replacement</u>.
External rattle or vibration noise	1. Inspect for a bent or loose hanger, loose heat shield, or loose clamp. 2. Inspect for an exhaust pipe causing interference. 3. Repair or replace the affected component.
Internal rattle	1. Test the components by tapping with a rubber mallet to confirm a rattle. 2. Replace the faulty catalytic converter, or muffler. Refer to one of the following procedures: • <u>Exhaust Manifold Replacement</u> • <u>Exhaust Muffler Replacement</u>

REPAIR INSTRUCTIONS

EXHAUST MANIFOLD REPLACEMENT

Removal Procedure

1. Remove the exhaust manifold heat shield. Refer to Exhaust Manifold Heat Shield Replacement.
2. Raise the vehicle by its full height. Refer to Lifting and Jacking the Vehicle.

Fig. 1: Exhaust Manifold Pipe Nut
Courtesy of GENERAL MOTORS COMPANY

3. Remove the exhaust manifold pipe nut (1).
4. Remove the exhaust manifold bracket bolts (2).
5. Remove the exhaust manifold pipe gasket.

Fig. 2: Exhaust Manifold Bolt

Courtesy of GENERAL MOTORS COMPANY

6. Remove the 10 exhaust manifold bolt (1).
7. Remove the exhaust manifold (2) and gasket.
8. Transfer parts as necessary.

Installation Procedure

Fig. 3: Exhaust Manifold Bolt

Courtesy of GENERAL MOTORS COMPANY

1. Install the exhaust manifold (2) and gasket.

CAUTION: Refer to Fastener Caution .

2. Install the 10 exhaust manifold bolt (1) and tighten to 20 (15 lb ft).
3. Raise the vehicle by its full height. Refer to Lifting and Jacking the Vehicle .

Fig. 4: Exhaust Manifold Pipe Nut
Courtesy of GENERAL MOTORS COMPANY

4. Install the exhaust manifold pipe gasket.
5. Install the exhaust manifold pipe nut (1) and tighten to 46 (34 lb ft).
6. Install the exhaust manifold bracket bolts (2) and tighten to 46 (34 lb ft).
7. Install the exhaust manifold heat shield. Refer to **Exhaust Manifold Heat Shield Replacement**.

EXHAUST PIPE REPLACEMENT (LFM)

Fig. 5: Exhaust Pipe (LFM)

Courtesy of GENERAL MOTORS COMPANY

Exhaust Pipe Replacement (LFM)

Callout	Component Name
Preliminary Procedures	
1. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
2. Remove the heated oxygen sensor 2. Refer to <u>Heated Oxygen Sensor Replacement - Sensor 2</u> .	
1	Exhaust Pipe Hanger (Qty: 1)
2	Exhaust Pipe Front Muffler Hanger (Qty: 2)
3	Exhaust Pipe - Rear Muffler Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 46 (34 lb ft)
4	Catalytic Converter - Exhaust Pipe Nut (Qty: 3)
5	Catalytic Converter - Exhaust Pipe Nut (Qty: 3)

EXHAUST FRONT PIPE REPLACEMENT (LL0)

Fig. 6: Exhaust Front Pipe

 Courtesy of GENERAL MOTORS COMPANY

Exhaust Muffler Replacement - Front (LL0)

Callout	Component Name
Preliminary Procedure Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Exhaust Front Muffler to Exhaust Muffler Nut (Qty: 2) CAUTION: Refer to <u>Component Fastener Tightening Caution</u> . Tighten 46 (34 lb ft)
2	Exhaust Front Pipe to Exhaust Muffler Nut (Qty: 2) CAUTION: Refer to <u>Component Fastener Tightening Caution</u> . Tighten 46 (34 lb ft)
3	Exhaust Muffler Hanger (Qty: 2)
4	Exhaust Muffler (Front)

EXHAUST MUFFLER REPLACEMENT

Removal Procedure

Fig. 8: Exhaust Rear Muffler Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove the exhaust pipe - rear muffler nut.
2. Disconnect the exhaust rear muffler assembly from the rubber hanger and remove it.

Installation Procedure

Fig. 9: Exhaust Rear Muffler Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Connect the exhaust rear muffler assembly to the rubber hanger and install.

CAUTION: Refer to Fastener Caution .

2. Install the exhaust pipe - rear muffler nut and tighten to 46 (34 lb ft).

FUEL TANK HEAT SHIELD REPLACEMENT (LL0)

Removal Procedure

Fig. 10: Front Exhaust Muffler Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove the front exhaust muffler assembly. Refer to **Exhaust Muffler Replacement - Front (LL0)**.
2. Remove the fuel tank strap retaining bolt and band (1) left side only.
3. Remove the 3 fuel tank heat shield retaining screw bolt (2).
4. Remove the fuel tank heat shield (3).

Installation Procedure

Fig. 11: Front Exhaust Muffler Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel tank heat shield (3).

CAUTION: Refer to Fastener Caution .

2. Install the 3 fuel tank heat shield retaining screw bolt (2) and tighten to 6 (53 lb in).
3. Install the fuel tank strap (1) retaining bolt and tighten to 20 (15 lb ft).
4. Install the front exhaust muffler assembly. Refer to **Exhaust Muffler Replacement - Front (LL0)**.

FUEL TANK HEAT SHIELD REPLACEMENT (LFM)

Removal Procedure

Fig. 12: Fuel Tank Strap Retaining Bolt And Band
Courtesy of GENERAL MOTORS COMPANY

1. Remove the exhaust pipe - rear muffler nut. Refer to **Exhaust Pipe Replacement (LFM)**.
2. Remove the fuel tank strap retaining bolt (2) and band (1) left side only.
3. Remove the 2 fuel tank heat shield retaining screw bolts (4).
4. Remove the fuel tank heat shield (3).

Installation Procedure

Fig. 13: Fuel Tank Strap Retaining Bolt And Band
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel tank heat shield (3).

CAUTION: Refer to Fastener Caution .

2. Install the 2 fuel tank heat shield retaining screw bolts (4) and tighten to 6 (53 lb in).
3. Install the fuel tank strap band (1) and tighten the fuel tank strap retaining bolt (2) to 20 (15 lb ft).
4. Install the exhaust pipe - rear muffler nut. Refer to **Exhaust Pipe Replacement (LFM)**.

EXHAUST MANIFOLD HEAT SHIELD REPLACEMENT

Fig. 14: Exhaust Manifold Heat Shield
 Courtesy of GENERAL MOTORS COMPANY

Exhaust Manifold Heat Shield Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement . 2. Remove the front headed oxygen sensor. Refer to Heated Oxygen Sensor Replacement - Sensor 1 .	
1	Exhaust Manifold Heat Shield Retaining Bolt (Qty: 4) CAUTION: Refer to Fastener Caution . Tighten 10 (89 lb in)
2	Exhaust Manifold Heat Shield

EXHAUST REAR MUFFLER HEAT SHIELD REPLACEMENT

Removal Procedure

Fig. 15: Exhaust Rear Muffler Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove the exhaust rear muffler. Refer to **Exhaust Muffler Replacement**.

Fig. 16: Exhaust Rear Muffler Heat Shield Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

2. Remove the 4 exhaust rear muffler heat shield retaining nuts.

Installation Procedure

Fig. 17: Exhaust Rear Muffler Heat Shield Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the 4 exhaust rear muffler heat shield retaining nuts and tighten to 1.2 (11 lb in).

Fig. 18: Exhaust Rear Muffler Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Install the exhaust rear muffler. Refer to Exhaust Muffler Replacement.

DESCRIPTION AND OPERATION

EXHAUST SYSTEM DESCRIPTION

Catalytic Converter

Fig. 19: Exhaust Manifold Bolt

Courtesy of GENERAL MOTORS COMPANY

The catalytic converter is an emission control device added to the engine exhaust system in order to reduce hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NO_x) pollutants from the exhaust gas. The catalytic converter is comprised of a ceramic monolith substrate, supported in insulation and housed within a sheet metal shell. The substrate may be washcoated with 3 noble metals, Platinum (Pt), Palladium (Pd) and Rhodium (Rh).

Exhaust Rear Muffler

Fig. 20: Exhaust Rear Muffler
Courtesy of GENERAL MOTORS COMPANY

The rear muffler is to reduce broad band engine exhaust noise. It is comprised of a series of perforated tubes and baffles to break up the sound waves and reflect them. It is made of stainless steel to protect the front muffler from corrosion.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - ENGINE MECHANICAL

Strategy Based Diagnostics

Perform the **Diagnostic System Check - Vehicle** .

All diagnosis on a vehicle should follow a logical process. Strategy based diagnostics is a uniform approach for repairing all systems. The diagnostic flow may always be used in order to resolve a system condition. The diagnostic flow is the place to start when repairs are necessary.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the engine.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

- Inspect for the correct oil level, proper oil viscosity and correct filter application.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, ambient temperature, engine temperature, amount of engine warm-up time and other specifics.
- Compare the engine sounds, if applicable, to a known good engine and make sure you are not trying to correct a normal condition.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating properly.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Base Engine Misfire without Internal Engine Noises**
- **Base Engine Misfire with Abnormal Internal Lower Engine Noises**
- **Base Engine Misfire with Abnormal Valve Train Noise**
- **Base Engine Misfire with Coolant Consumption**
- **Base Engine Misfire with Excessive Oil Consumption**
- **Engine Noise on Start-Up, but Only Lasting a Few Seconds**

OIL PRESSURE DIAGNOSIS AND TESTING

Special Tools

- **EN-21867-850** Adapter Oil Pressure Check
- **EN-50207** Oil Pressure Switch Remover/Installer
- **KM-498-B** Oil Pressure Gauge

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

Fig. 5: Oil Pressure Switch

Courtesy of GENERAL MOTORS COMPANY

1. Remove the oil pressure switch (1) using the **EN-50207** oil pressure switch remover/installer.
2. Clean the thread.

Measurement Procedure

Fig. 6: Installing EN-21867-850 adapter Oil Pressure Check
Courtesy of GENERAL MOTORS COMPANY

1. Install the **EN-21867-850** adapter oil pressure check (1) to the **KM-498-B** oil pressure gauge (2).
2. Install the **EN-21867-01** adapter oil pressure check (1) with **EN 498-B** oil pressure gauge (2) to the oil pressure switch hole.
3. Start the engine.
4. Check oil pressure.

At idling speed, the oil pressure must be at least 110 kPa (15.95 psi) and the oil temperature must be less than or equal to 120°C (170°F).

5. Switch off the engine.
6. Remove the **EN-21867-01** adapter oil pressure check (1) with **EN 498-B** oil pressure gauge (2) from the oil pressure switch hole.

Installation Procedure

Fig. 7: Oil Pressure Switch
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the oil pressure switch and tighten to 18 (13 lb ft).
2. Check the engine oil level.

ENGINE COMPRESSION TEST

Removal Procedure

1. Remove the ignition coil cover. Refer to Ignition Coil Cover Replacement (LL0), Ignition Coil Cover Replacement (LFM).
2. Remove the spark plugs. Refer to Spark Plug Replacement (LL0) , Spark Plug Replacement (LFM) .
3. Remove the relay holder cover.
4. Remove the fuel pump relay.

Measurement Procedure

Fig. 8: Engine Compression Test Tool
Courtesy of GENERAL MOTORS COMPANY

1. Install the suitable engine compression test tool to the spark plug hole.
2. Start the engine (approximately 4 seconds).
3. Compare the compression values.

NOTE: **Engine revs at least 300/min.**
